# ***Discovery! How we did it and what we know so far***

***Kyle Cranmer,  
New York University***

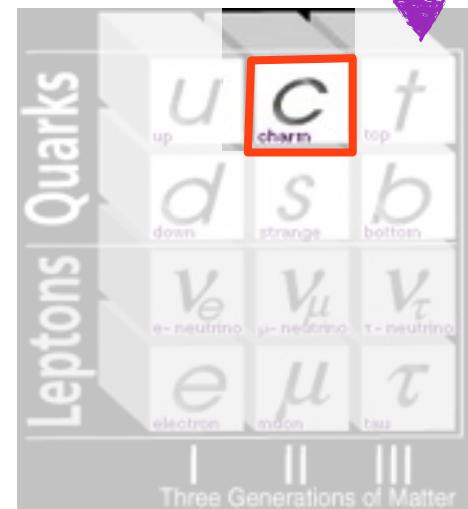

# Last Really Exciting Discoveries

Sam Ting, Nobel Prize 1976

My Ph.D. advisor, Sau Lan Wu  
co-discoverer of gluon (1979)

Top Quark discovery in  
1995, exciting, but expected  
(as heavy as a gold atom)

# Fundamental Particles & Interactions

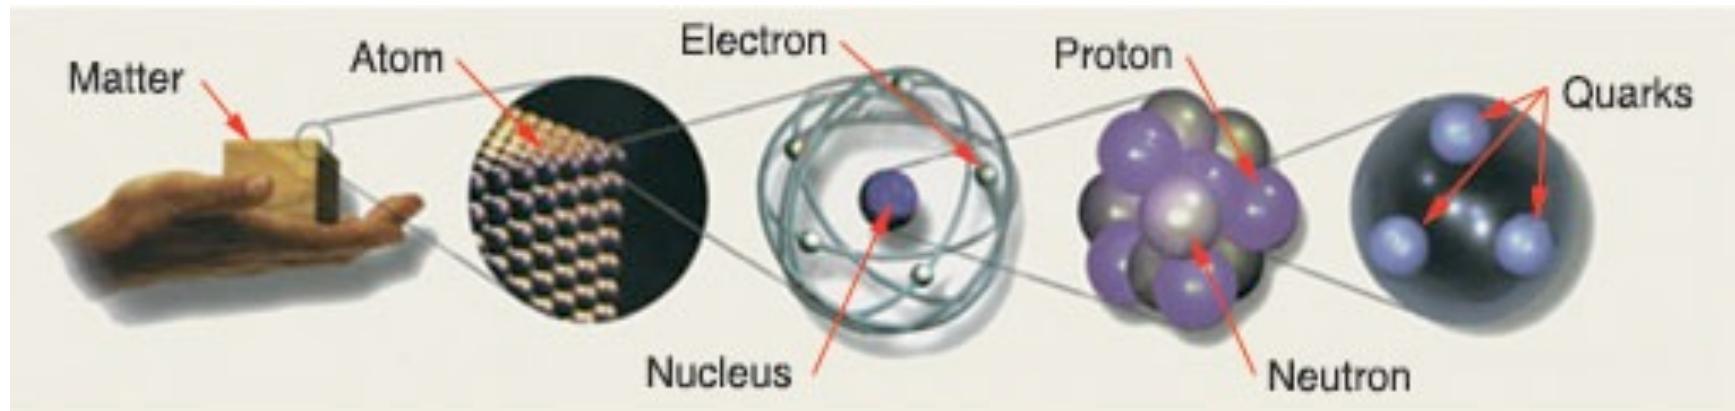

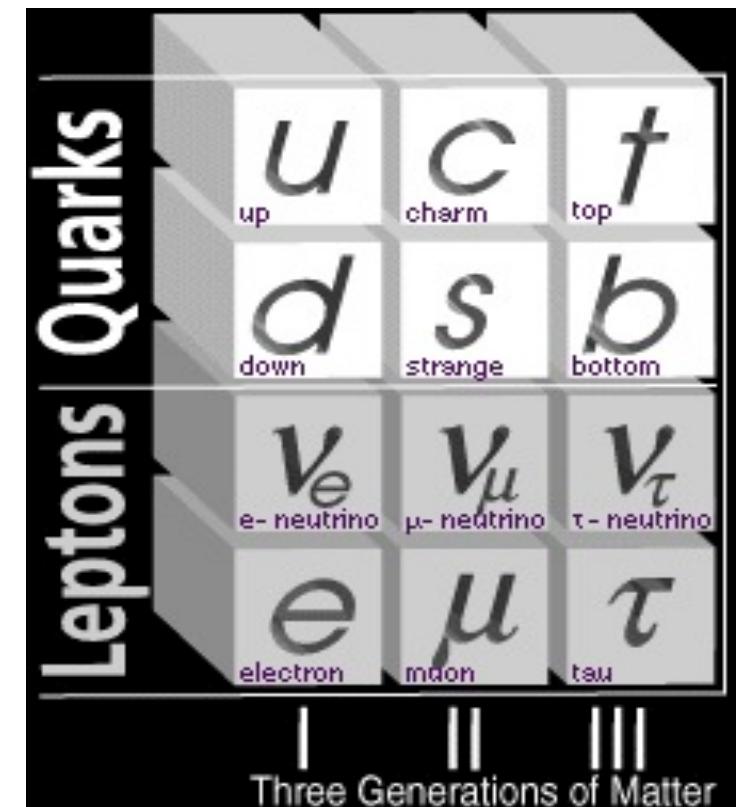

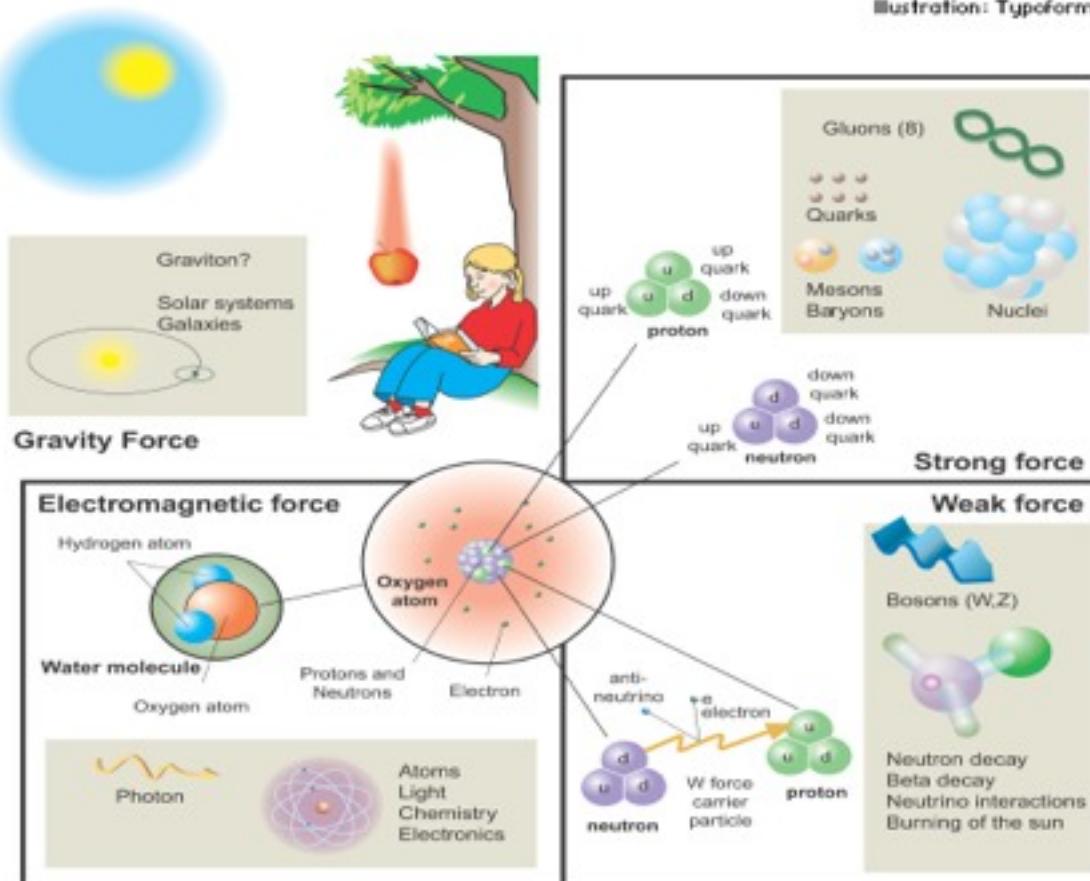

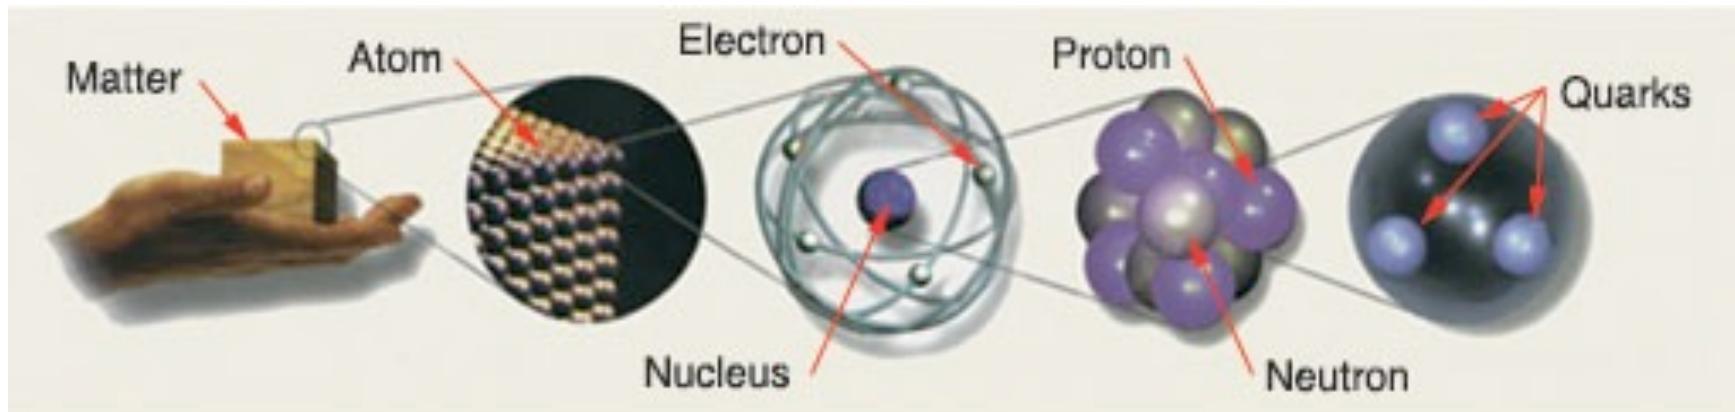

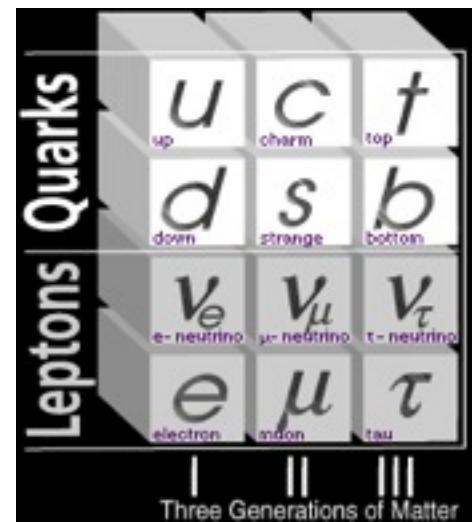

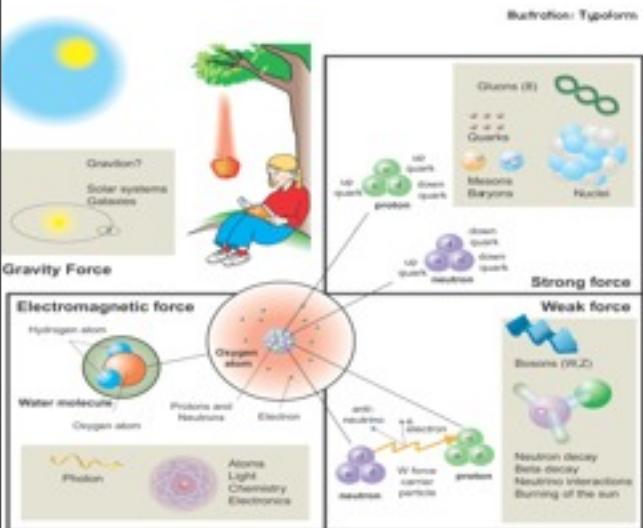

Illustration: Typoform

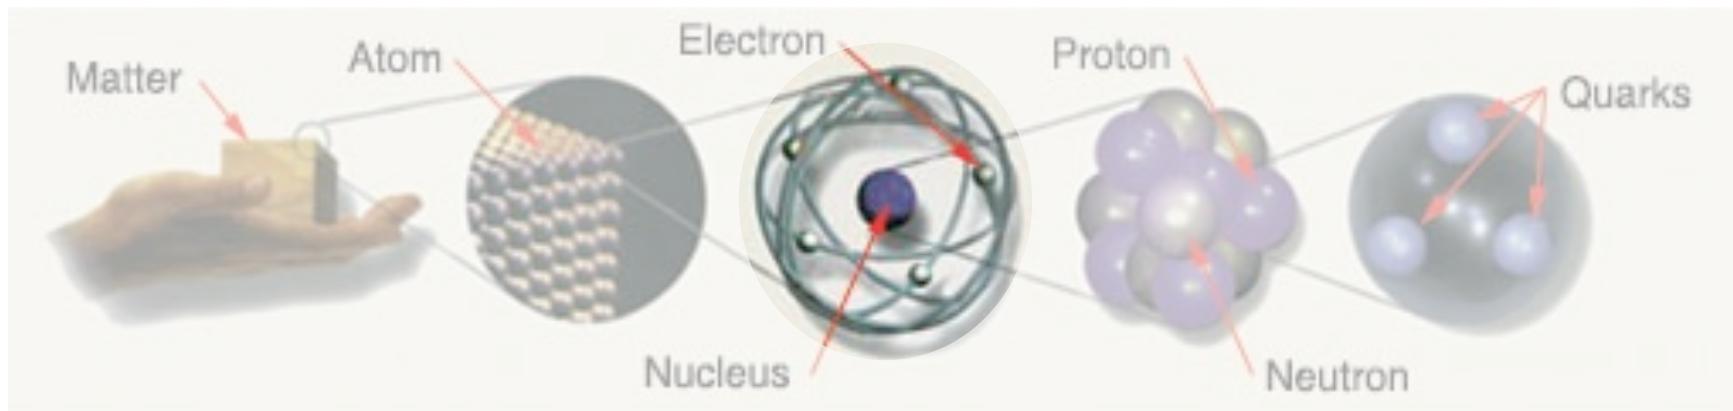

# Fundamental Particles & Interactions

$$\begin{aligned}
 \mathcal{L}_{SM} = & \underbrace{\frac{1}{4}\mathbf{W}_{\mu\nu} \cdot \mathbf{W}^{\mu\nu} - \frac{1}{4}B_{\mu\nu}B^{\mu\nu} - \frac{1}{4}G_{\mu\nu}^a G_a^{\mu\nu}}_{\text{kinetic energies and self-interactions of the gauge bosons}} \\
 & + \underbrace{\bar{L}\gamma^\mu(i\partial_\mu - \frac{1}{2}g\tau \cdot \mathbf{W}_\mu - \frac{1}{2}g'YB_\mu)L + \bar{R}\gamma^\mu(i\partial_\mu - \frac{1}{2}g'YB_\mu)R}_{\text{kinetic energies and electroweak interactions of fermions}} \\
 & + \underbrace{\frac{1}{2}|(i\partial_\mu - \frac{1}{2}g\tau \cdot \mathbf{W}_\mu - \frac{1}{2}g'YB_\mu)\phi|^2 - V(\phi)}_{W^\pm, Z, \gamma, \text{and Higgs masses and couplings}} \\
 & + \underbrace{g''(\bar{q}\gamma^\mu T_a q) G_\mu^a}_{\text{interactions between quarks and gluons}} + \underbrace{(G_1 \bar{L}\phi R + G_2 \bar{R}\phi_c L + h.c.)}_{\text{fermion masses and couplings to Higgs}}
 \end{aligned}$$

# The mass of the electron

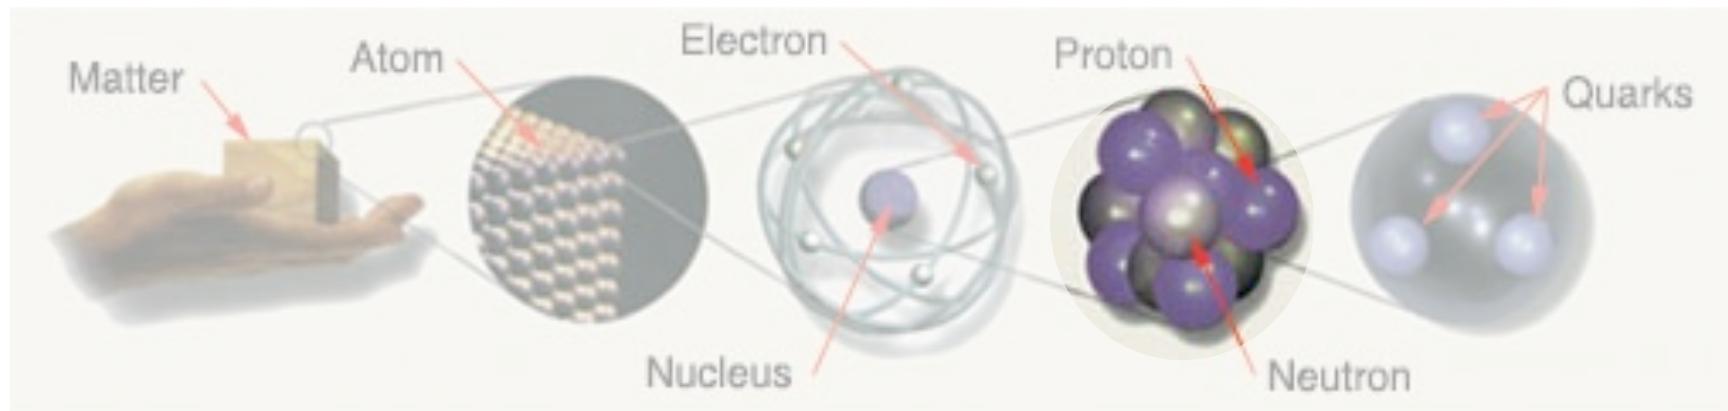

The electron is a fundamental particle deriving its mass from interactions with the Higgs field

The mass of the electron sets the scale of the atom

- without the Higgs, the universe would be a very different place

$$a_0 = \frac{\hbar^2}{m_e e^2}$$

# The origin of mass

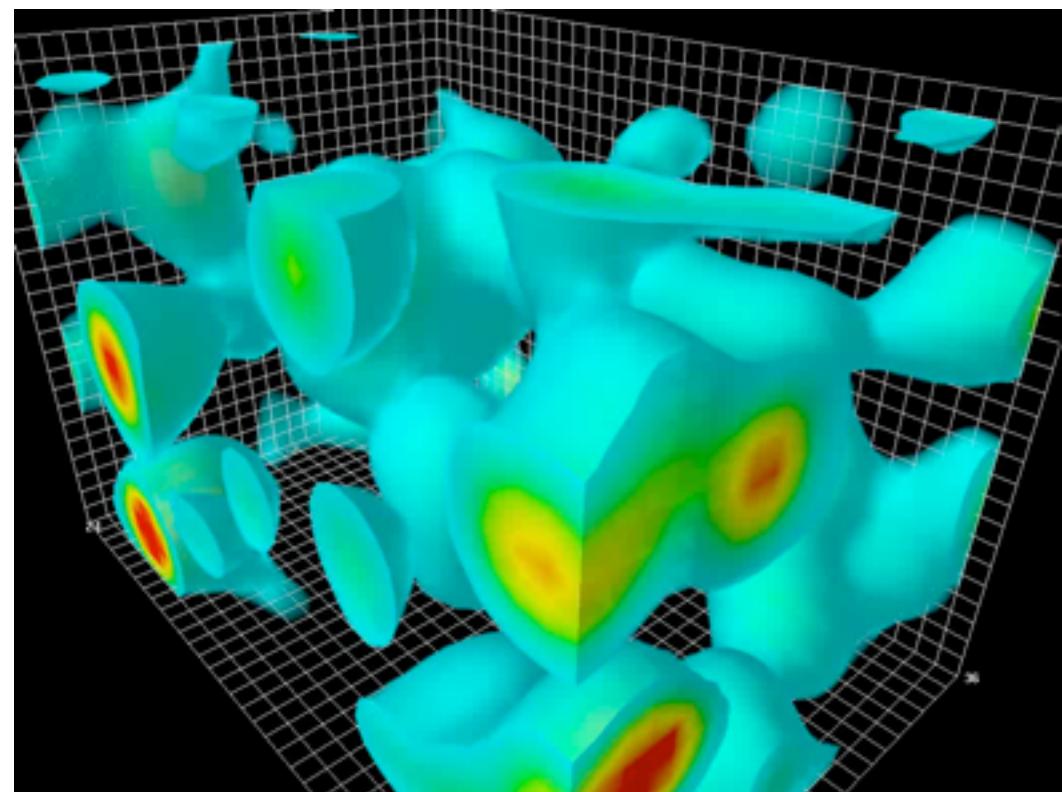

When you step on the scale, most of your mass comes from the nuclei of atoms.

Quark masses only contribute ~1%

Most mass comes from energy  
in the quarks and gluons inside very  
dynamic protons and neutrons

$$E = mc^2$$

# Fermi's theory of beta decay

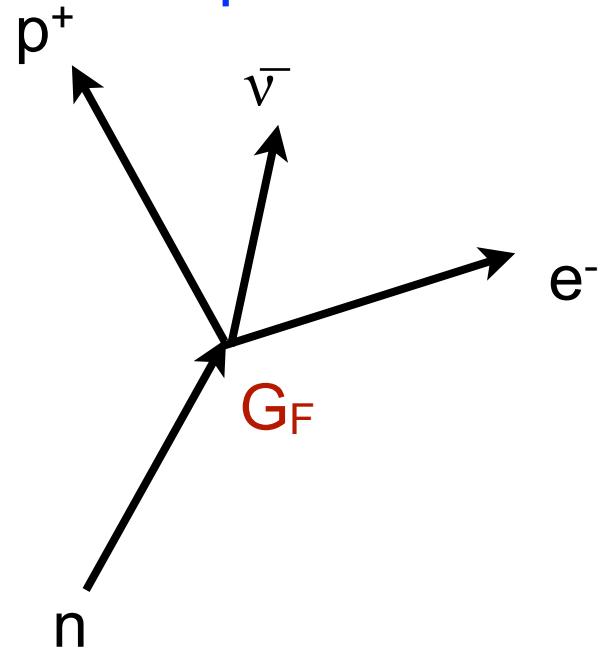

In 1933 Fermi proposed a theory of beta decay

- four-fermion vertex with coupling constant  $G_F$

The theory has a serious sickness

- **unitarity violation:** interaction probability grows with energy until probabilities are greater than 1.
- The theory is non-renormalizable.

Now we see Fermi theory as an “effective theory” valid to energy scales comparable with the mass of the W-boson.

# Fermi's theory of beta decay

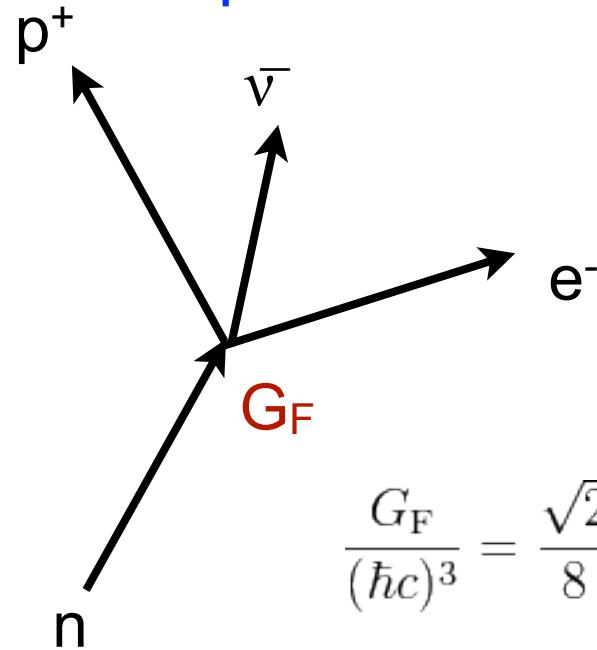

In 1933 Fermi proposed a theory of beta decay

- ▶ four-fermion vertex with coupling constant  $G_F$

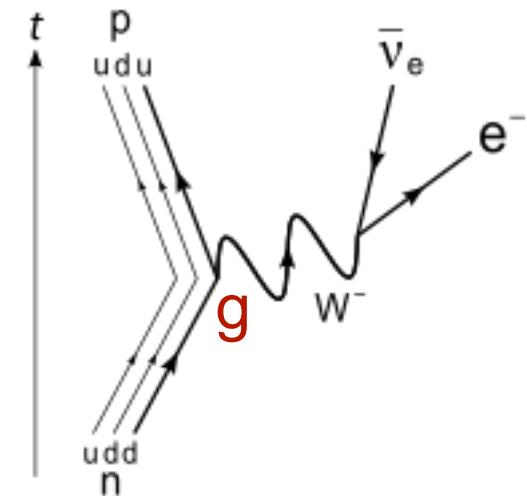

The theory has a serious sickness

- ▶ **unitarity violation:** interaction probability grows with energy until probabilities are greater than 1.
- ▶ The theory is non-renormalizable.

Now we see Fermi theory as an “effective theory” valid to energy scales comparable with the mass of the W-boson.

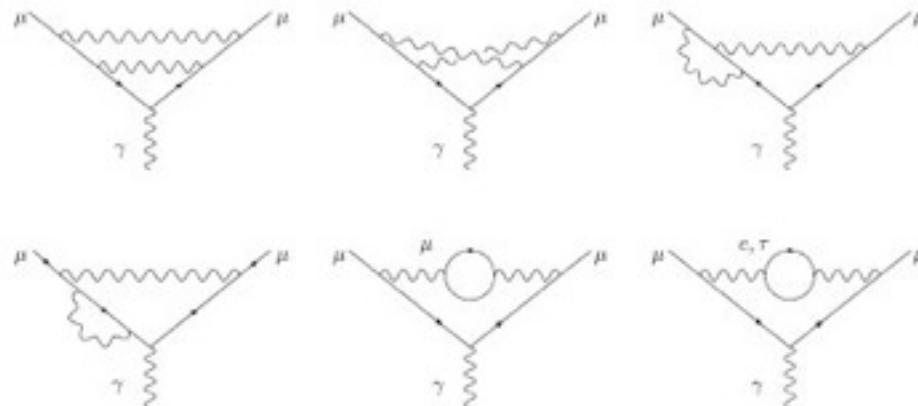

$$\frac{G_F}{(\hbar c)^3} = \frac{\sqrt{2}}{8} \frac{g^2}{m_W^2} = 1.16637(1) \times 10^{-5} \text{GeV}^{-2} .$$

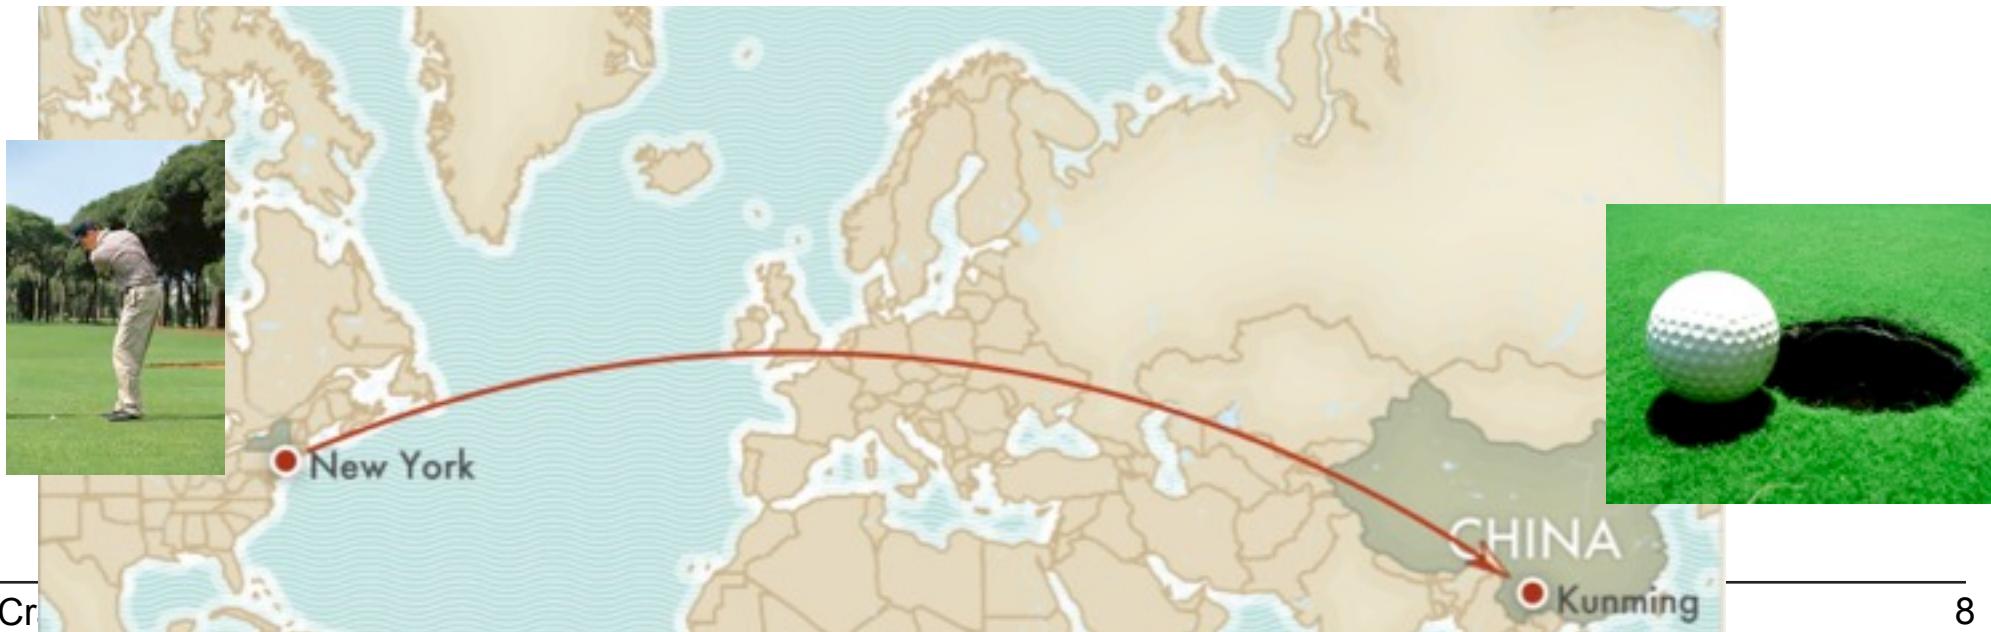

# The Success of the Standard Model & QFT

Non-trivial aspects of the theory have been tested to < 1 ppm

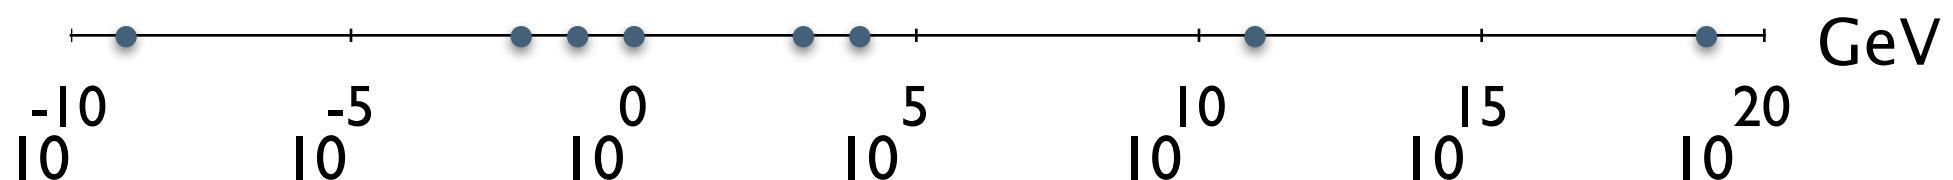

- These results give us confidence QFT's concept of renormalization

$$a_\mu (\text{exp}) = 11\ 659\ 208 (6) \times 10^{-10} \text{ (0.5 ppm)}$$

events per second

Run Number: 182747, Event Number: 63217197

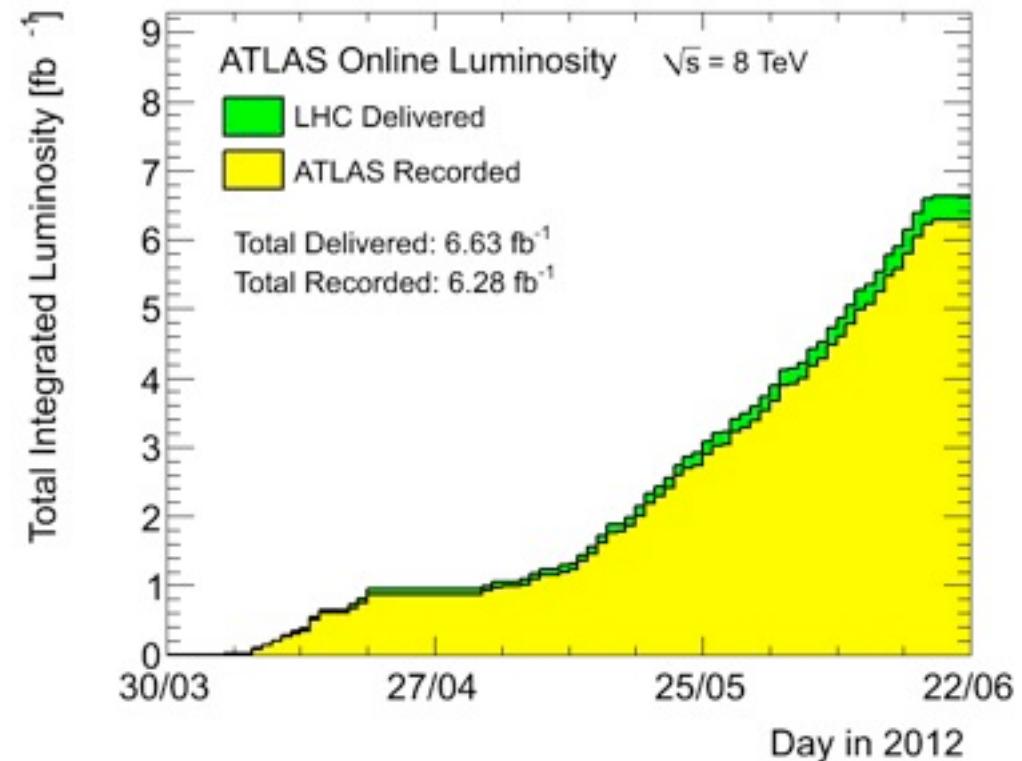

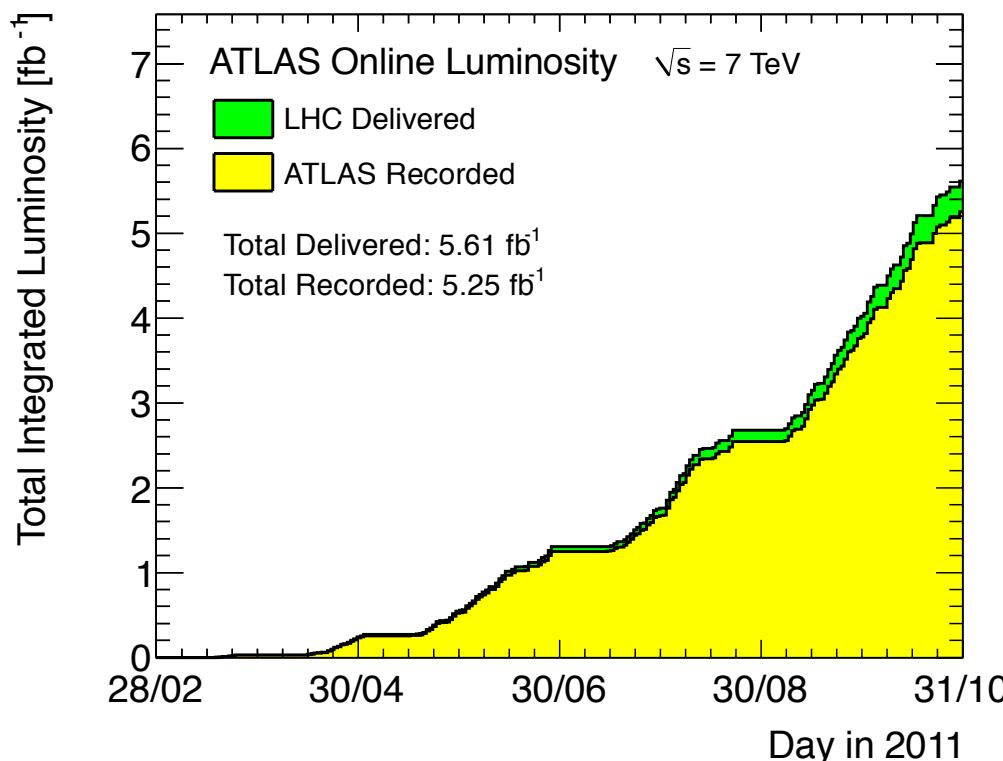

Date: 2011-05-28 13:06:57 CEST

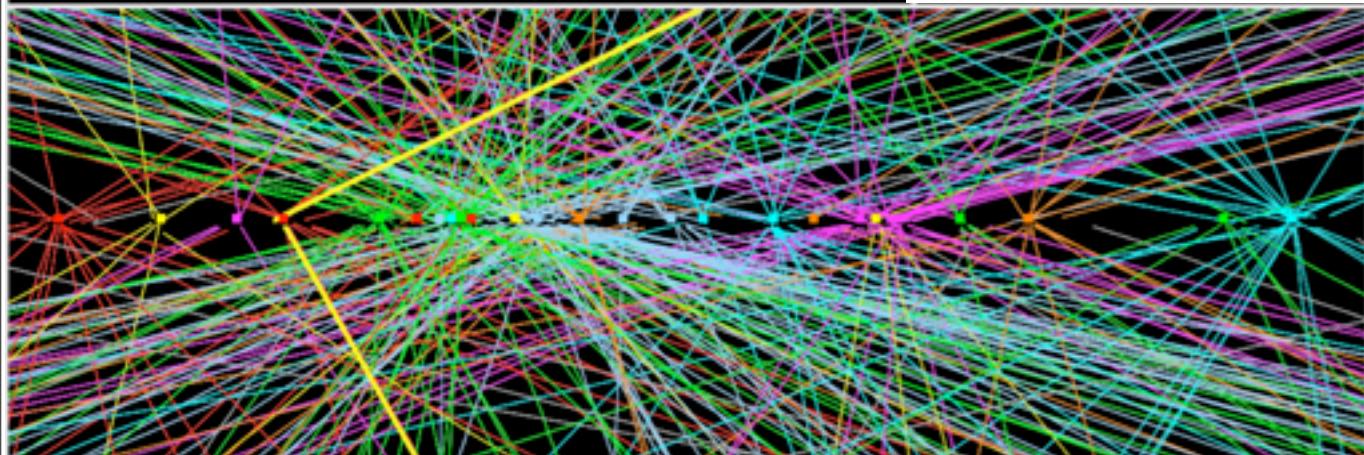

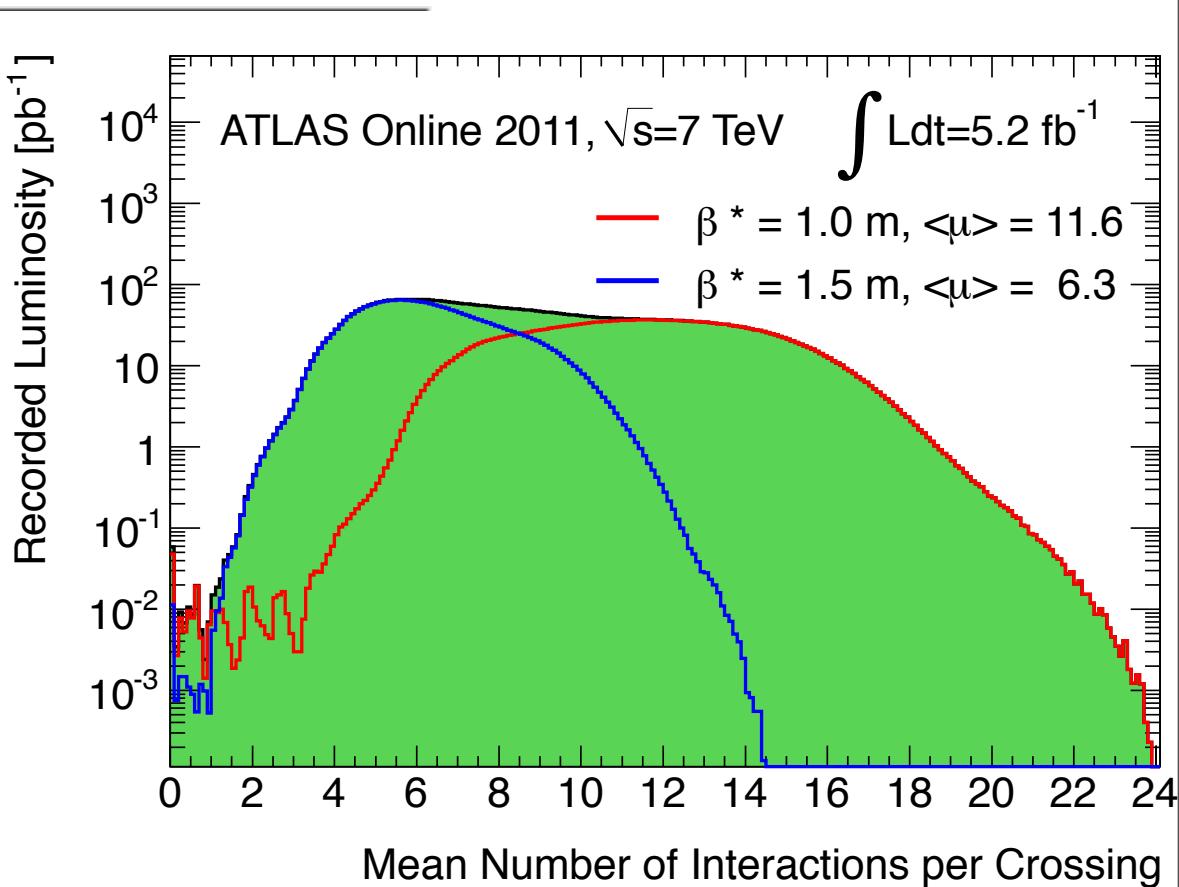

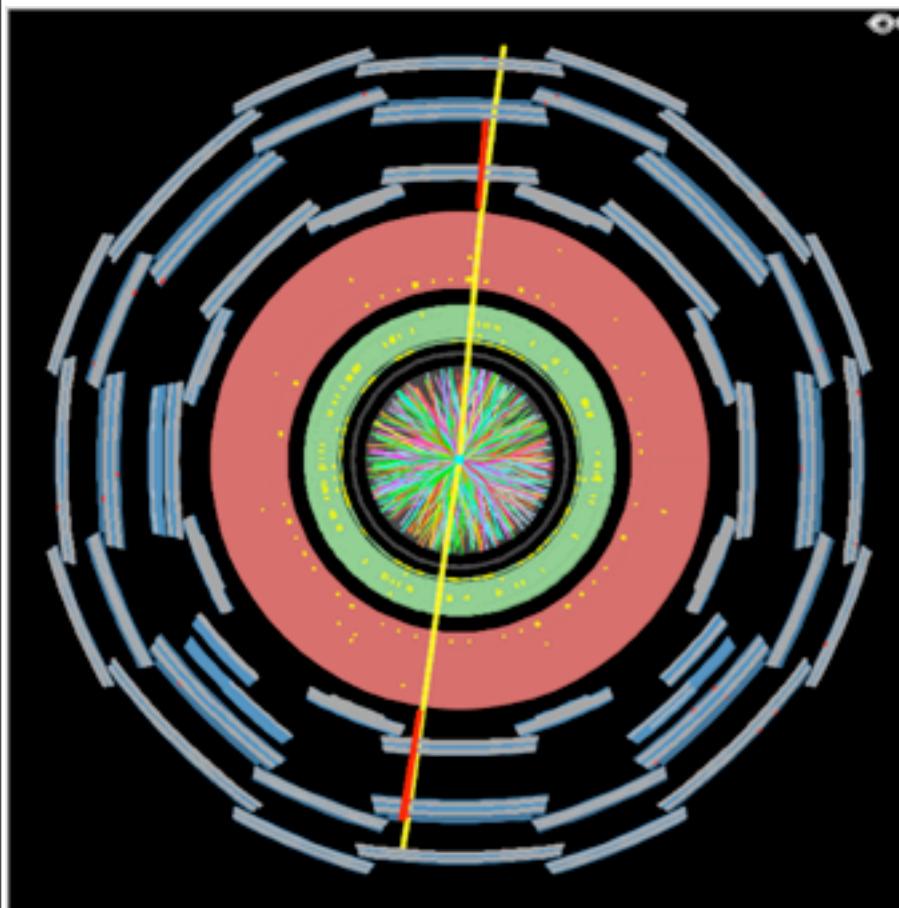

The LHC has been performing very well

- $>5 \text{ fb}^{-1}$  delivered in 2011 at 7 TeV
- already  $>6 \text{ fb}^{-1}$  delivered in 2012, running at 8 TeV
- peak luminosity  $\sim 7 \cdot 10^{33} \text{ cm}^{-2}\text{s}^{-1}$  (high pile-up environment)

ATLAS data taking efficiency  $>93\%$

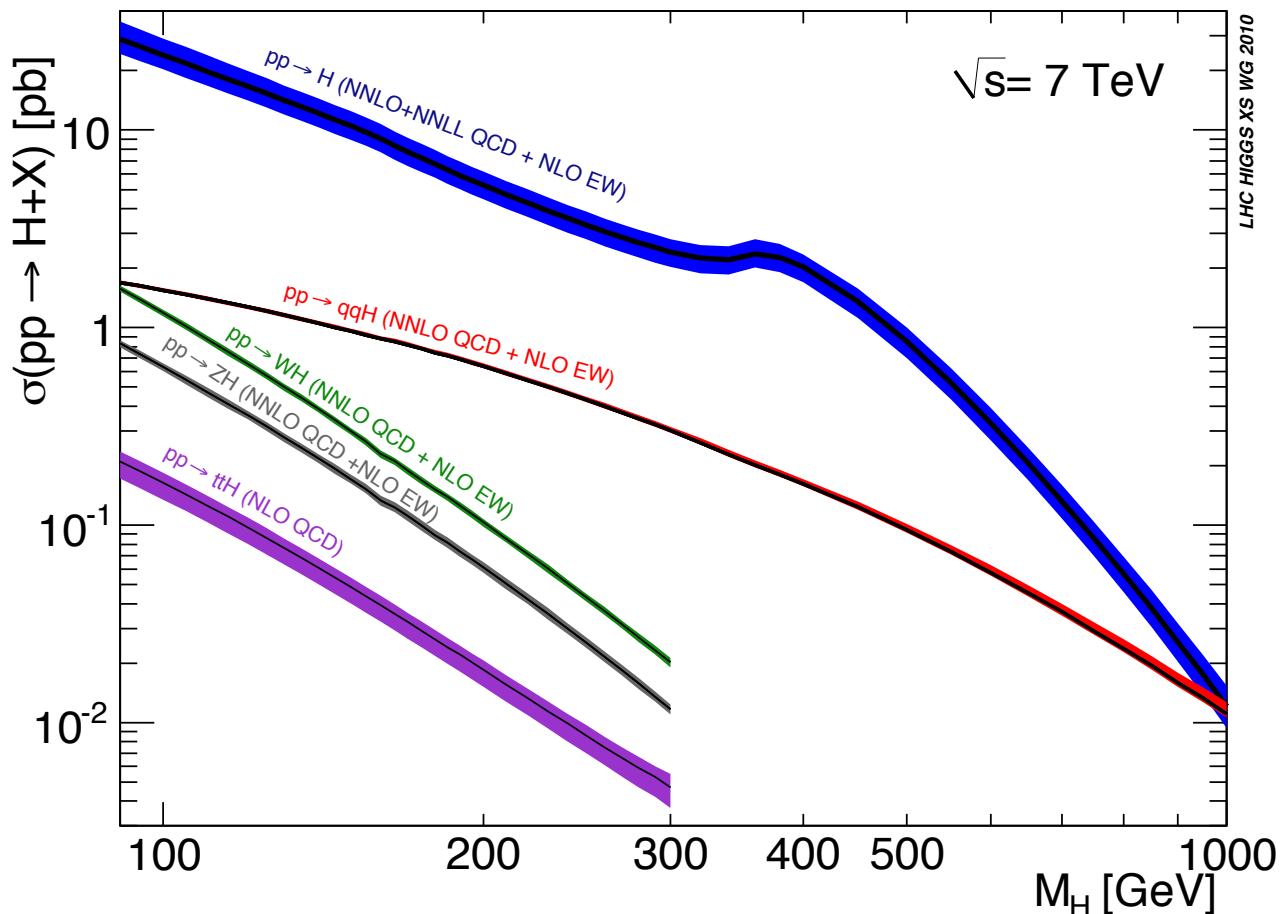

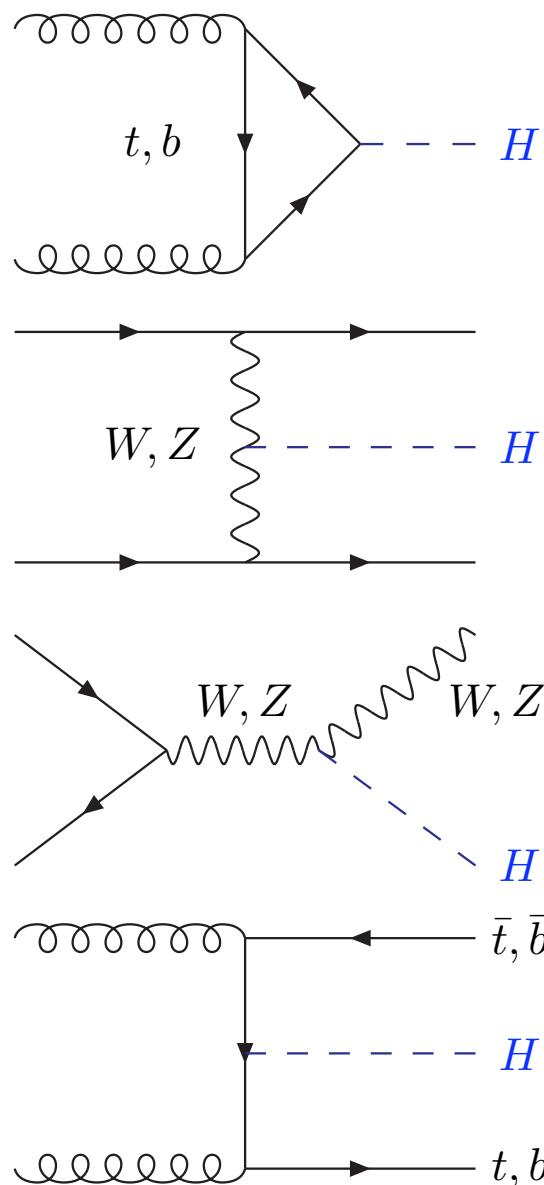

# Pile-up

$Z \rightarrow \mu\mu$  with 25 pile-up interactions in 2012

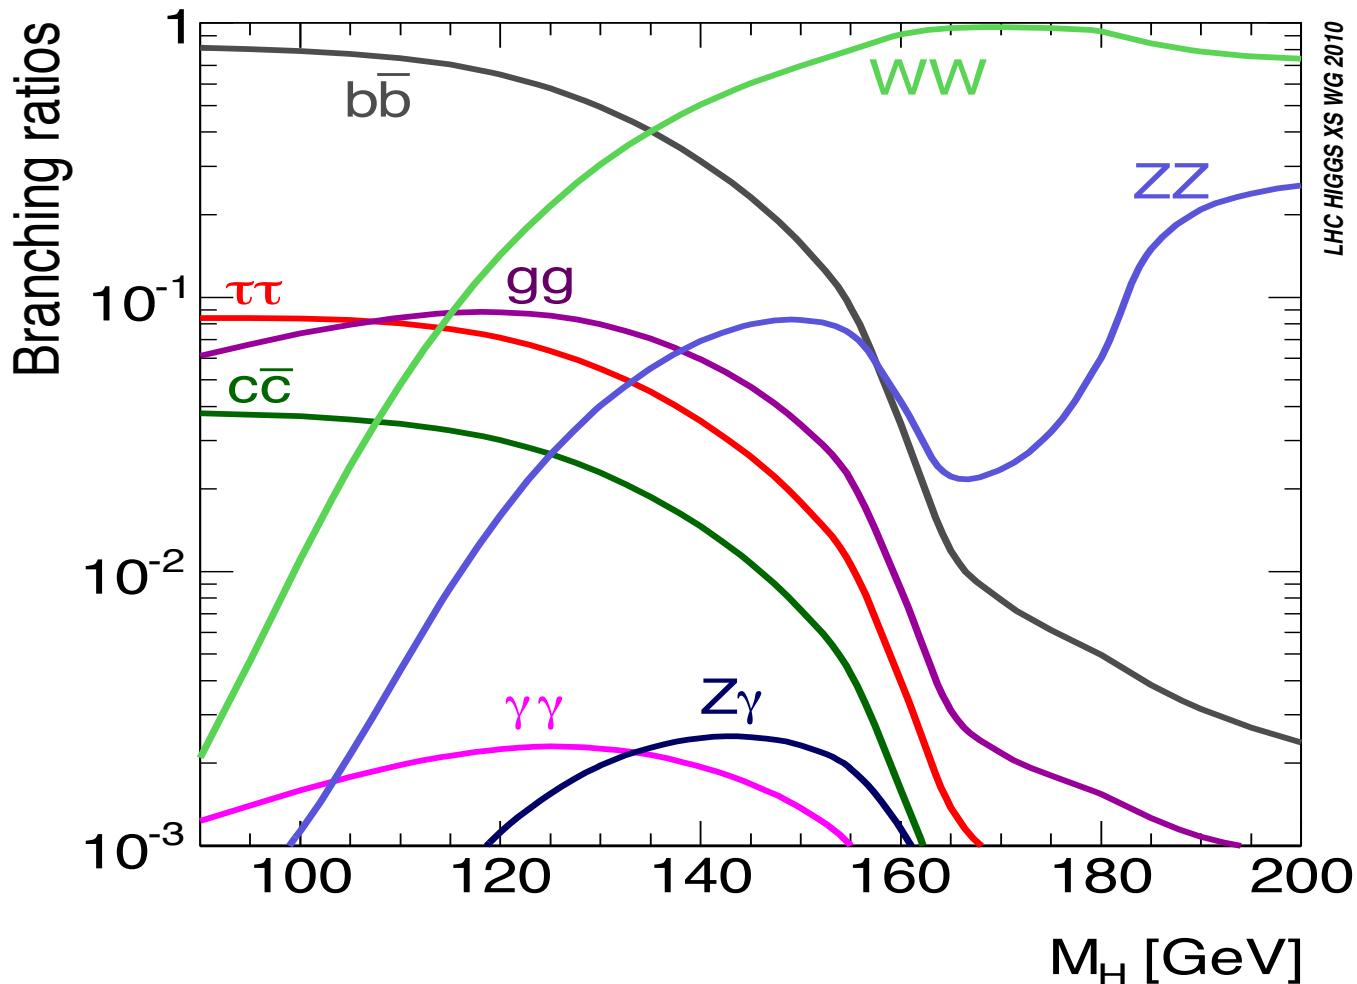

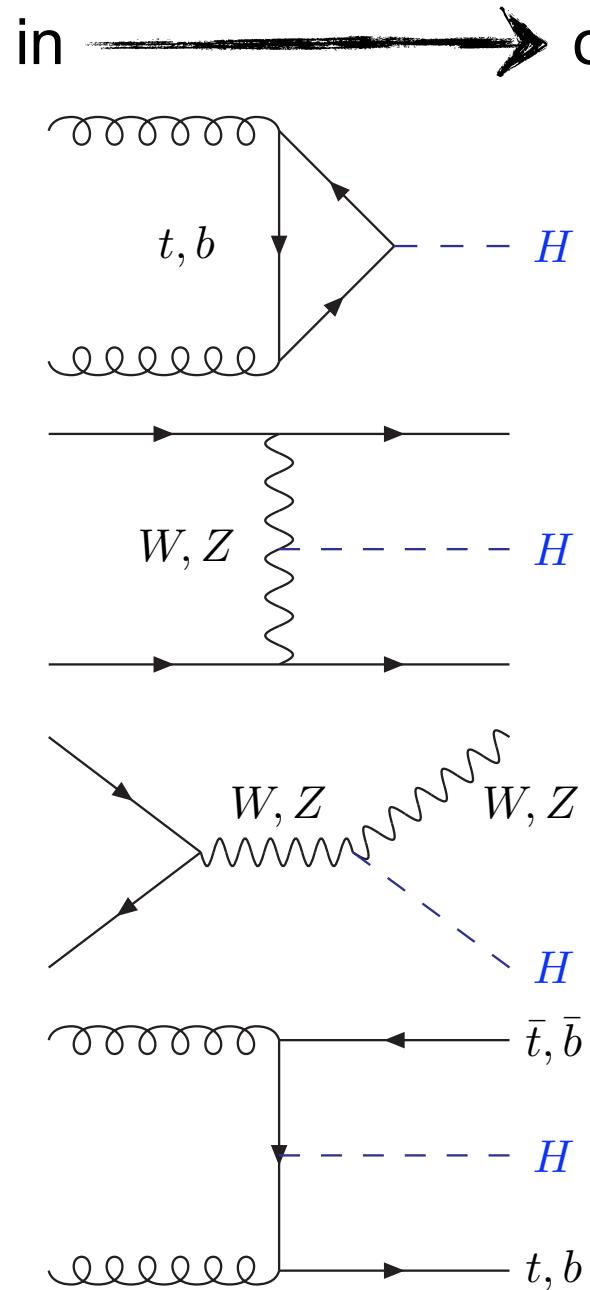

# Standard Model Higgs Properties

in → out

The Higgs boson can be produced via different interactions.  
Production cross section  $\sigma$  depends on the unknown Higgs mass

# Standard Model Higgs Properties

The Higgs boson then decays in one of several possible final states  
The fraction of each decay mode also depends on the unknown Higgs mass

# *Putting the Higgs back together again*

Don't believe the media:  $E \neq mc^2$

# *Putting the Higgs back together again*

Don't believe the media:  $E \neq mc^2$

What Einstein really said:

$$E^2 = (mc^2)^2 + (|\vec{p}|c)^2$$

# Putting the Higgs back together again

Don't believe the media:  $E \neq mc^2$

What Einstein really said:

$$E^2 = (mc^2)^2 + (|\vec{p}|c)^2$$

Every Physics I student knows energy and momentum are conserved

$$E_{\text{Higgs}} = E_{\text{before}} = E_{\text{after}} = \sum_i E_i$$
$$\vec{p}_{\text{Higgs}} = \vec{p}_{\text{before}} = \vec{p}_{\text{after}} = \sum_i \vec{p}_i$$

# Putting the Higgs back together again

Don't believe the media:  $E \neq mc^2$

What Einstein really said:

$$E^2 = (mc^2)^2 + (|\vec{p}|c)^2$$

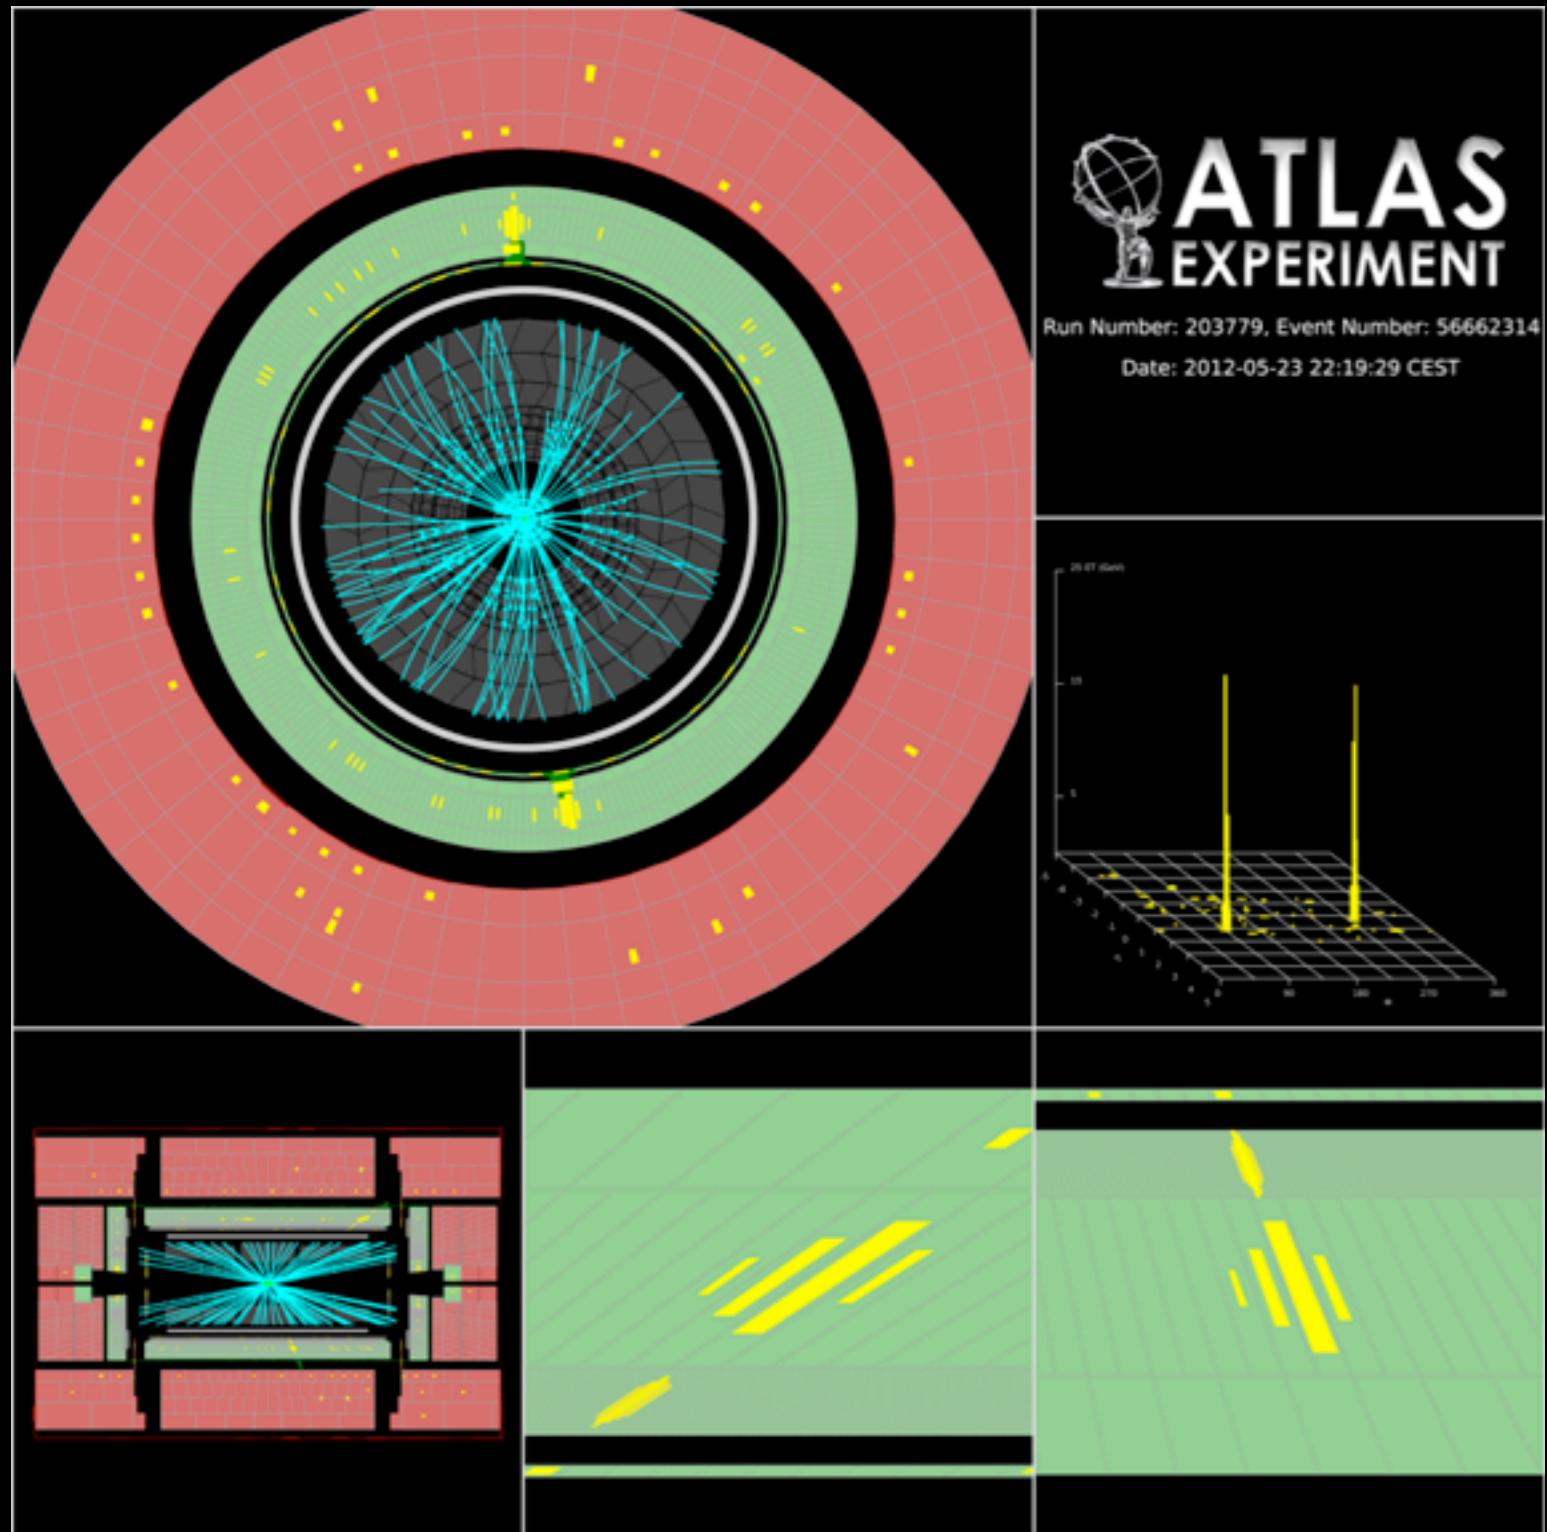

Every Physics I student knows energy and momentum are conserved

$$E_{\text{Higgs}} = E_{\text{before}} = E_{\text{after}} = \sum_i E_i$$
$$\vec{p}_{\text{Higgs}} = \vec{p}_{\text{before}} = \vec{p}_{\text{after}} = \sum_i \vec{p}_i$$

Thus, we can estimate the mass of the Higgs with

$$m_H = \sqrt{E_{\text{after}}^2/c^4 - |\vec{p}_{\text{after}}|^2/c^2}$$

$H \rightarrow \gamma\gamma$

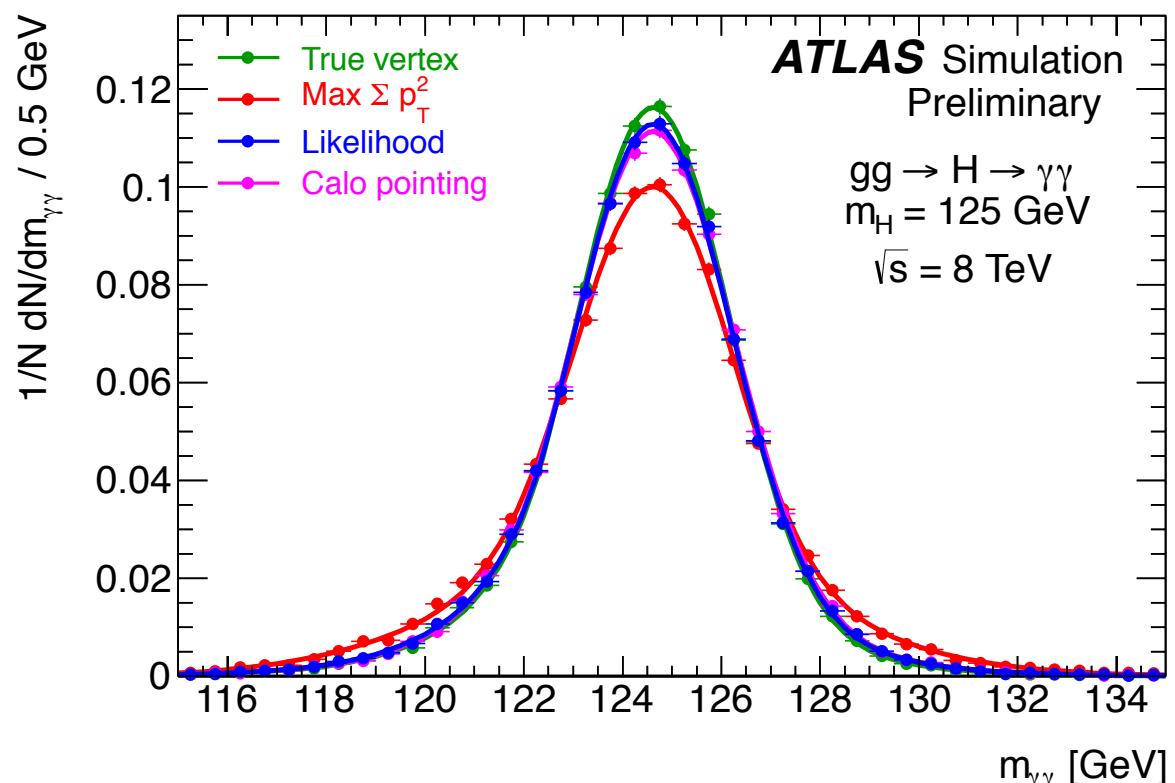

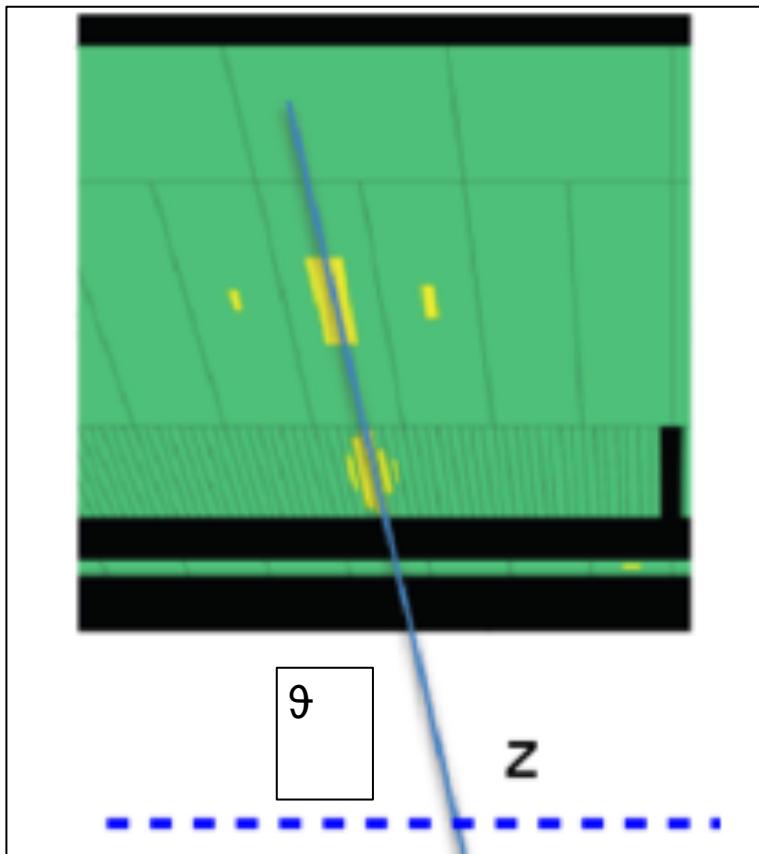

# The 2-photon invariant mass

The invariant mass of the 2 photons will peak at the Higgs boson mass

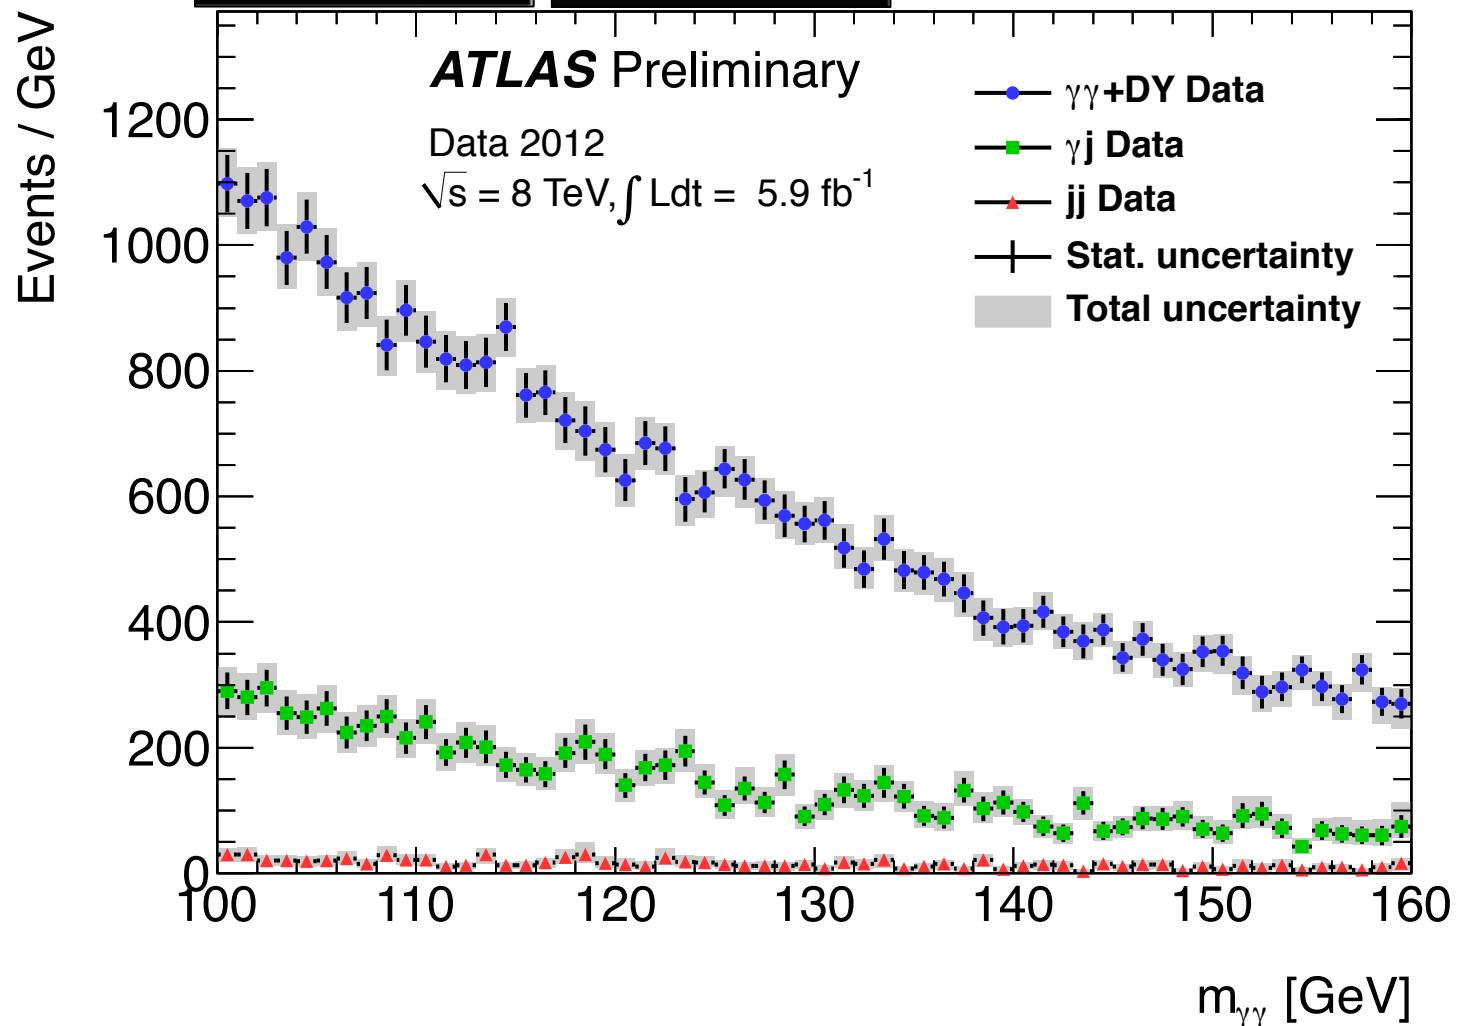

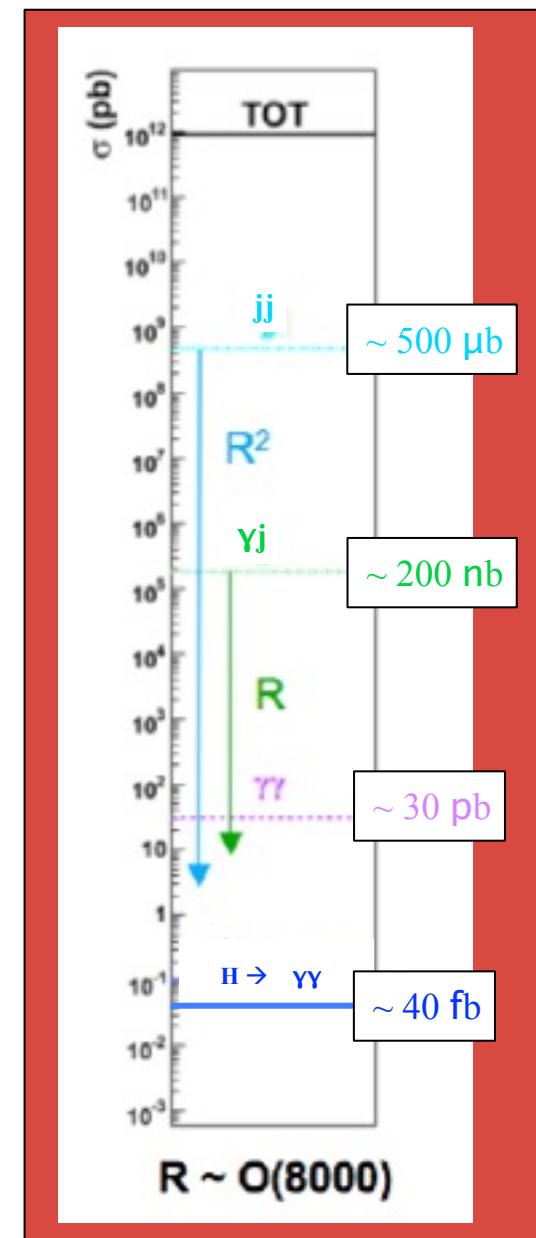

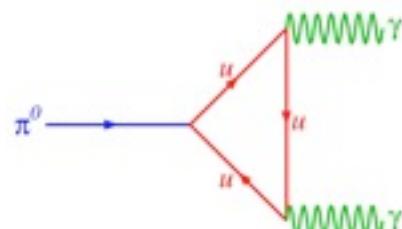

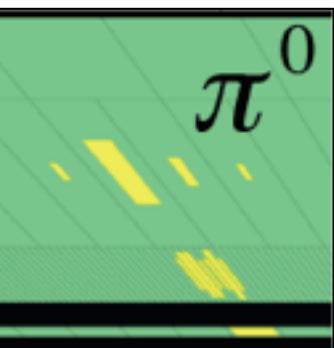

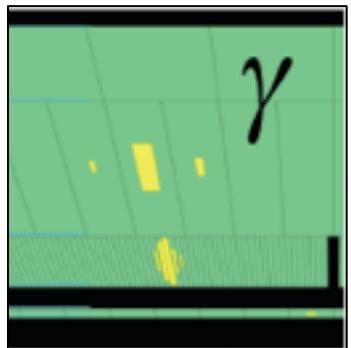

$$m_{\gamma\gamma} = \sqrt{2E_1E_2(1 - \cos\theta)}$$

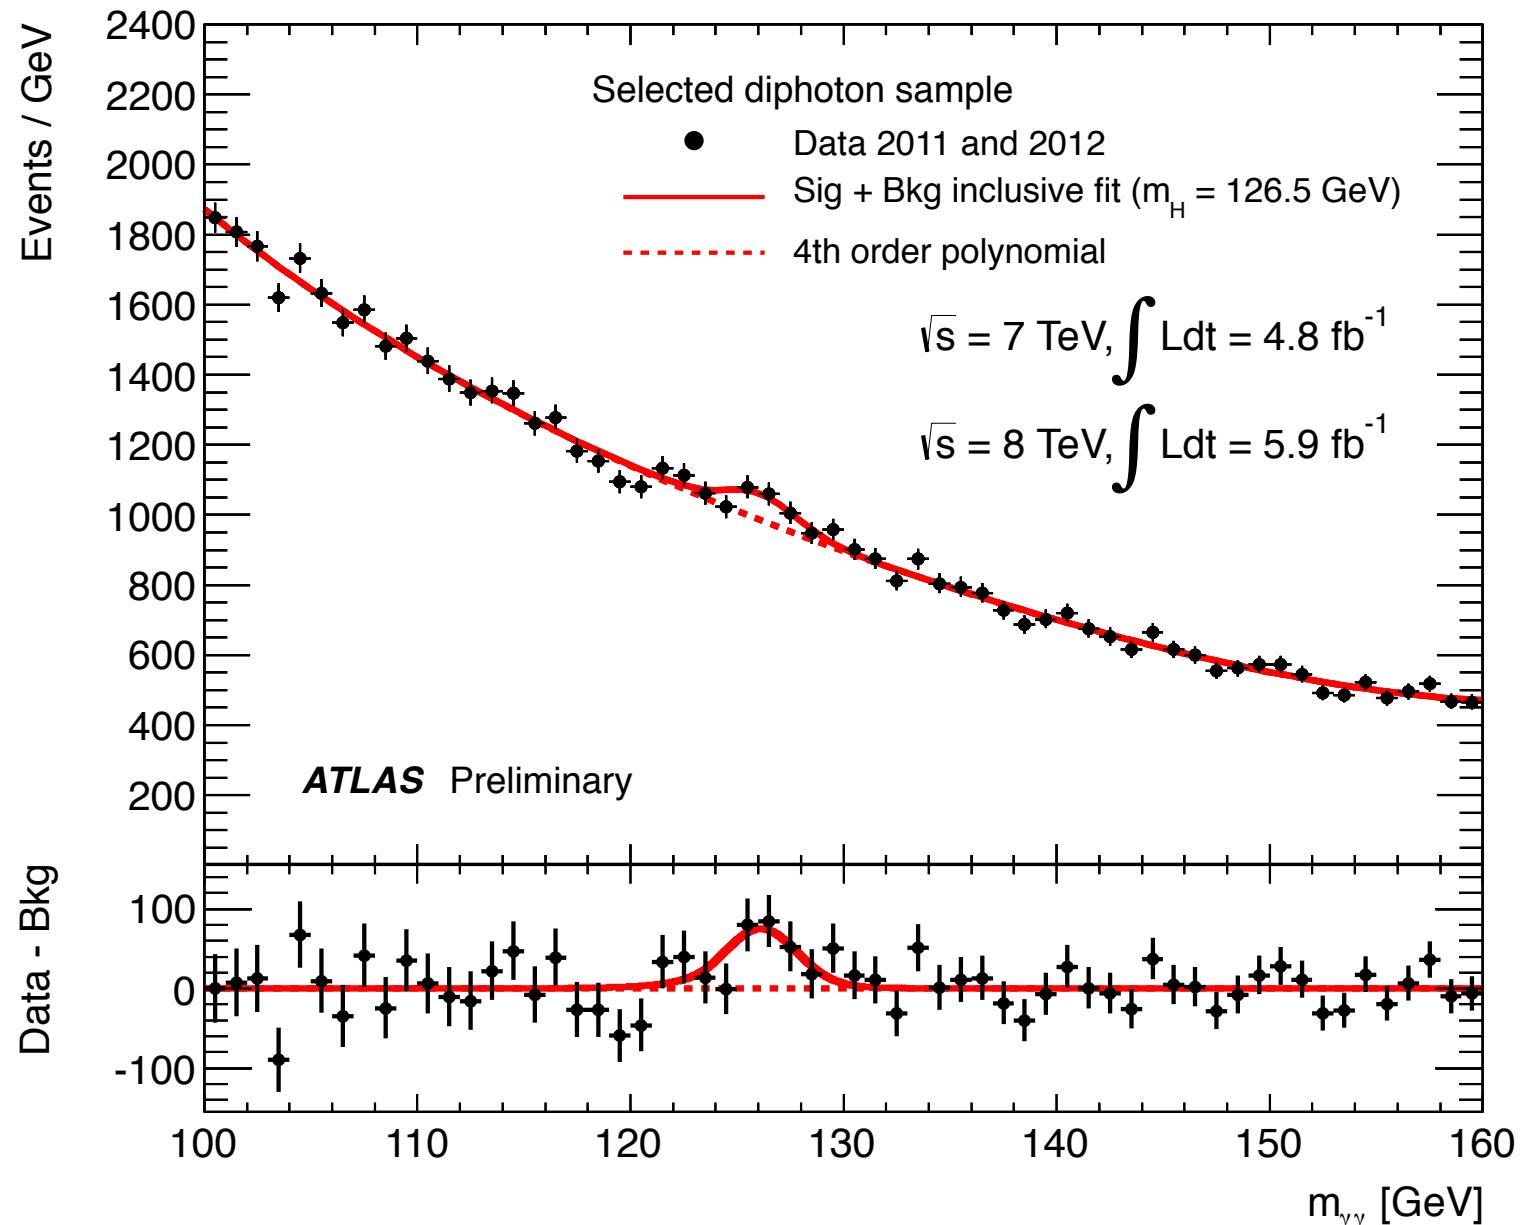

Measure  $\gamma$  direction with calorimeter to find location of primary vertex

Measure  $\gamma$  direction with calorimeter to find location of primary vertex

# Background composition

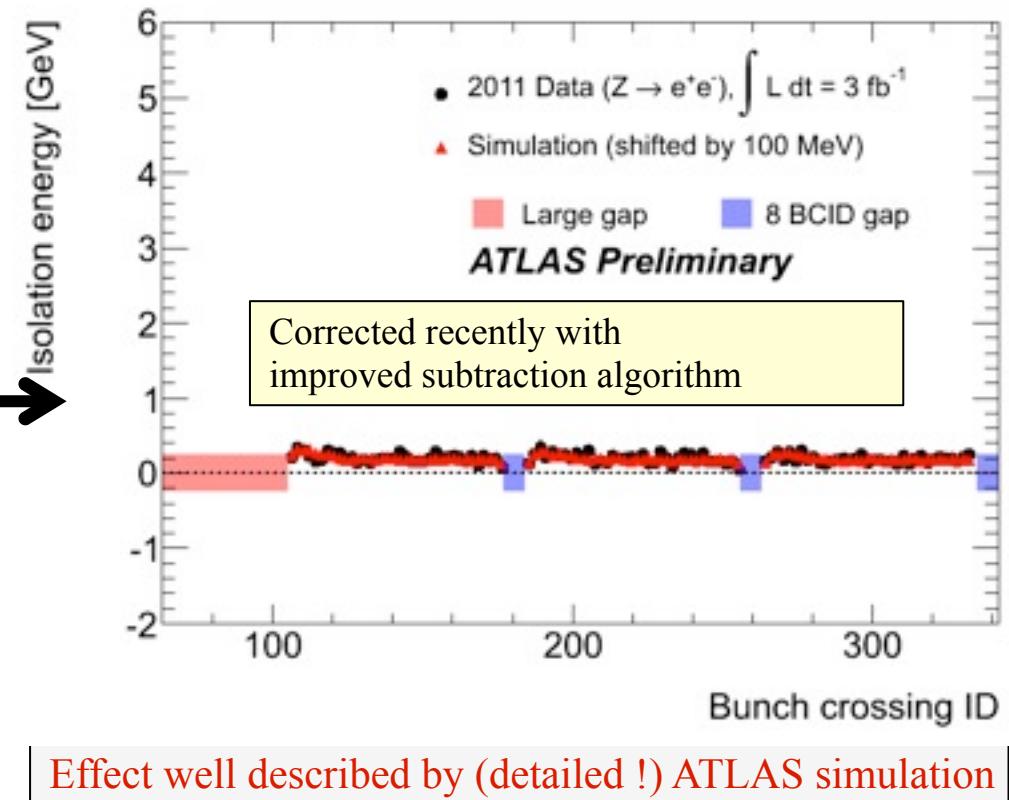

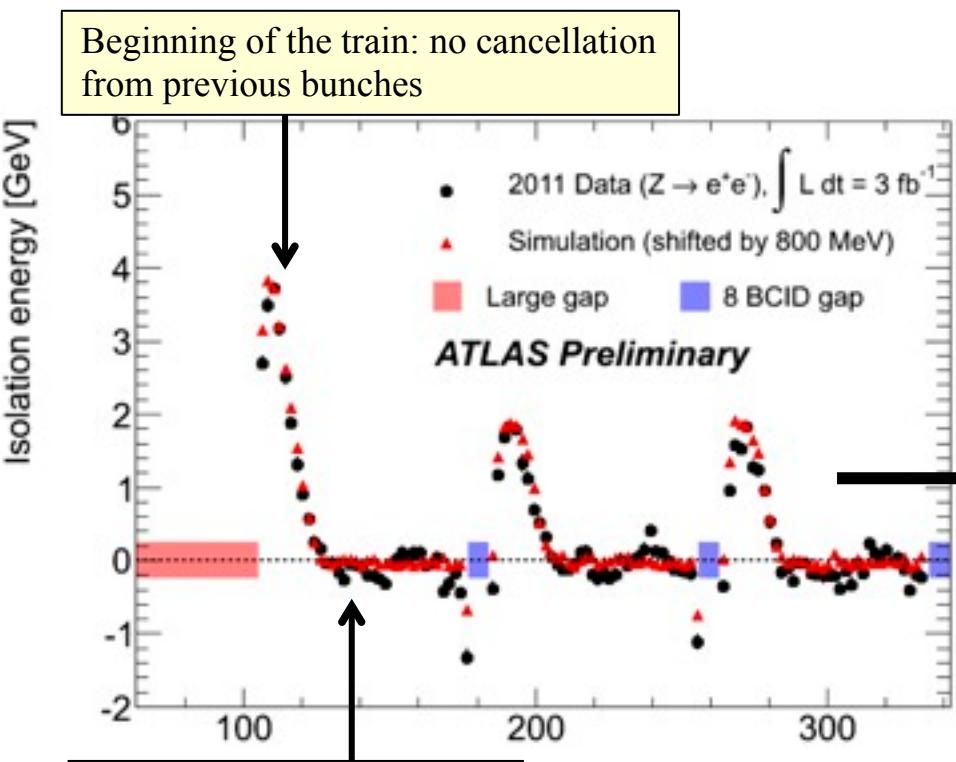

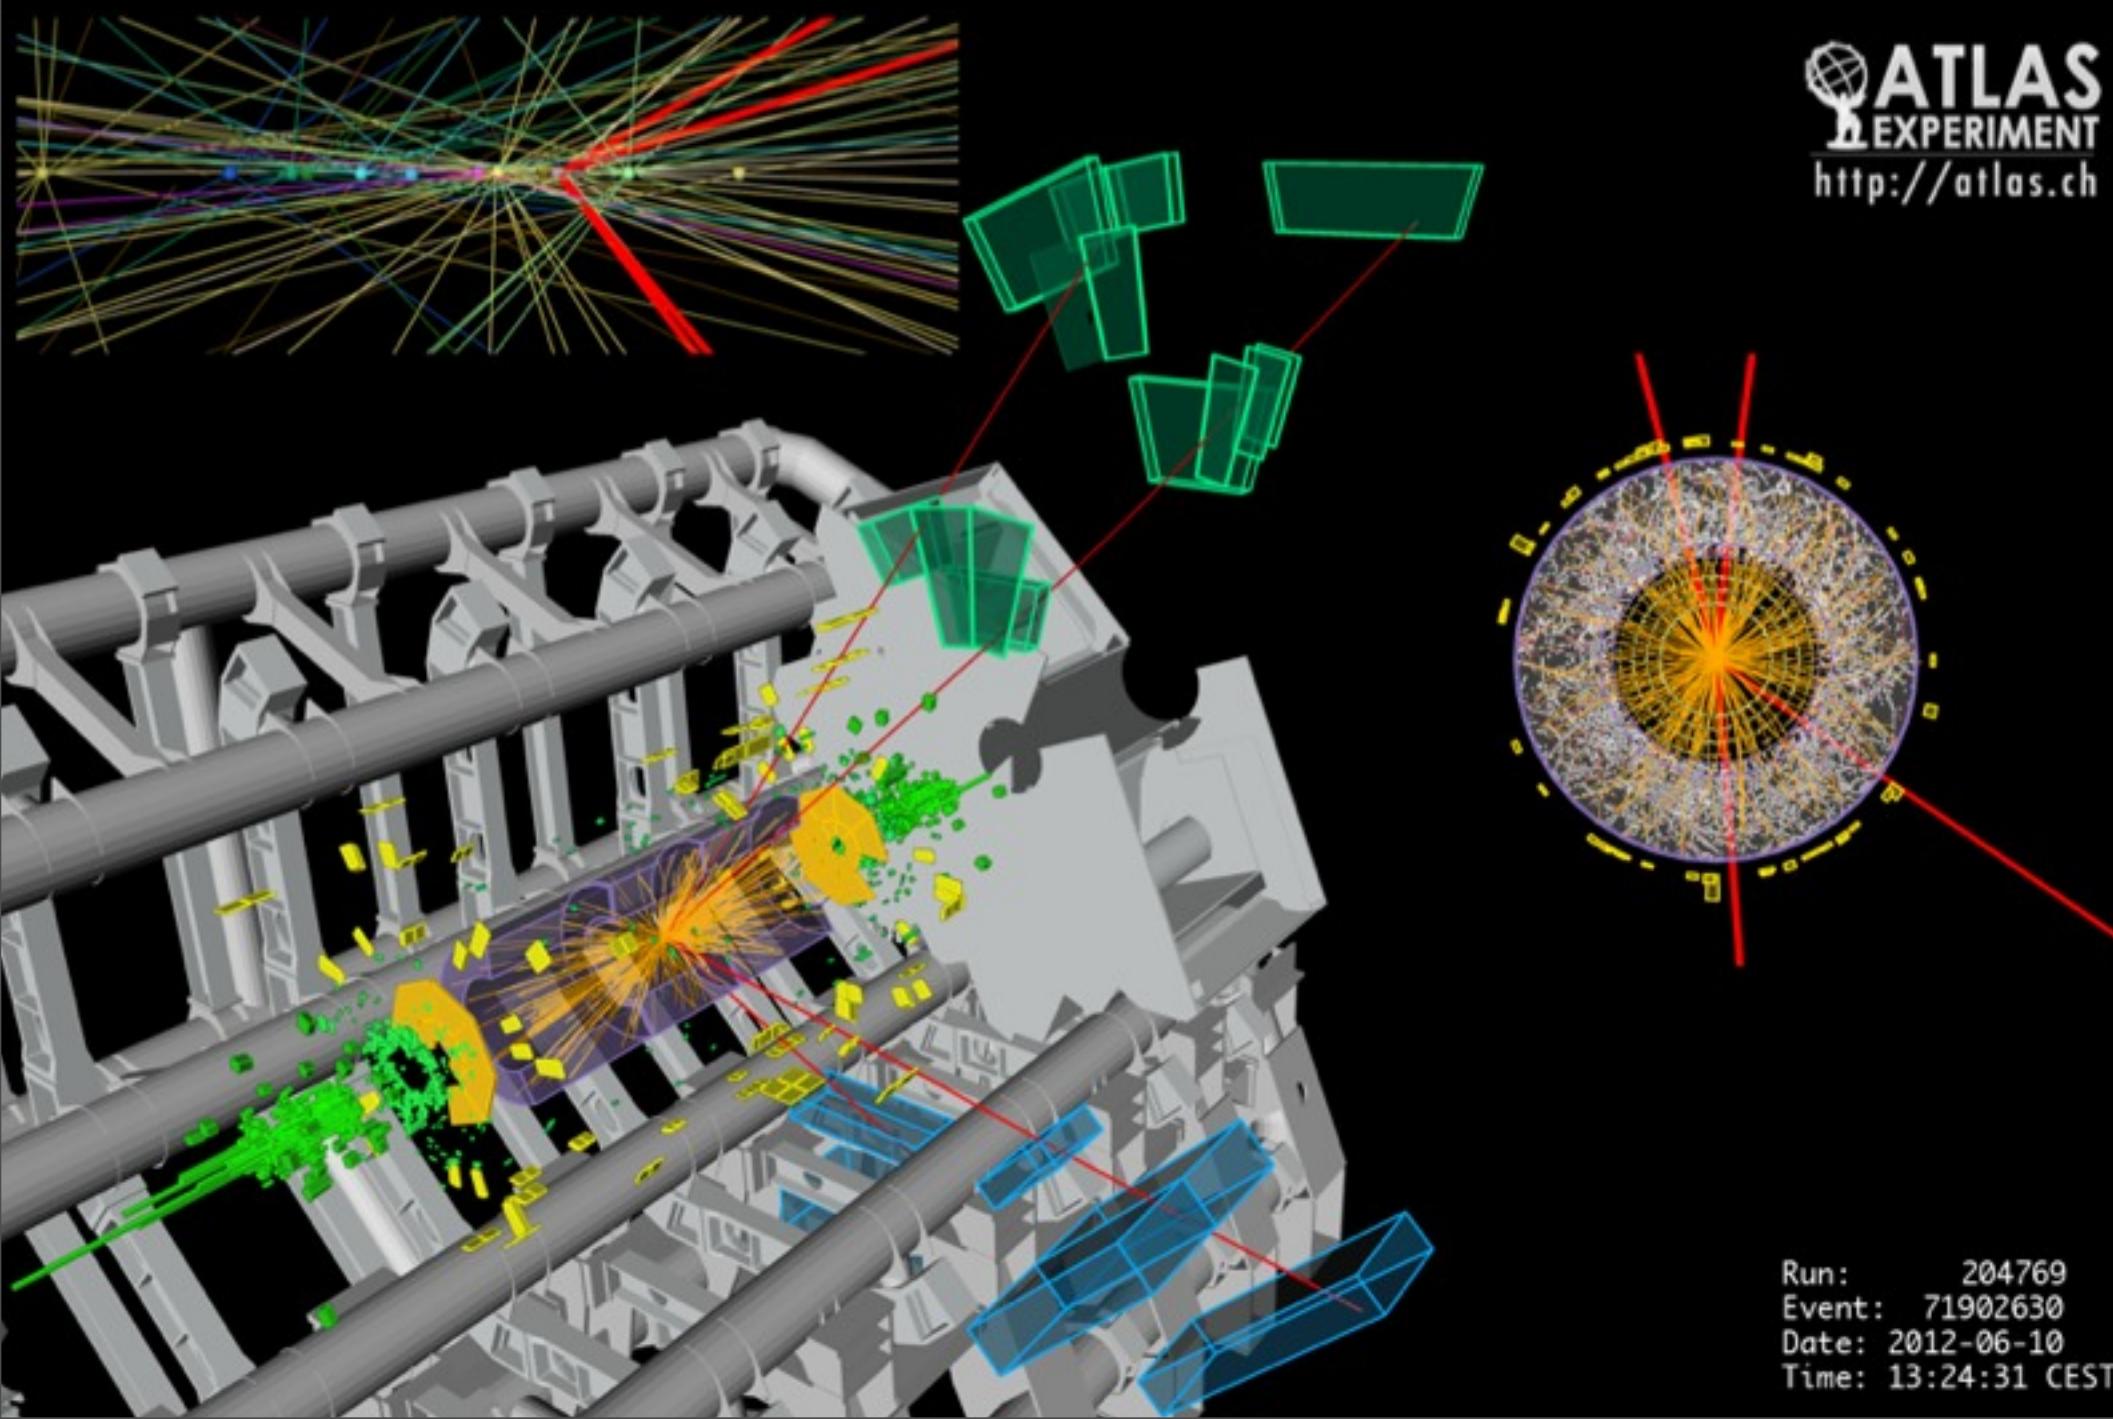

# Photon Isolation and Pileup

## Photon are required to be isolated

“Pile-up” contribution subtracted. If subtraction is not perfect, residual dependence of the isolation energy on the location along the beam

$$H \rightarrow ZZ \rightarrow 4l$$

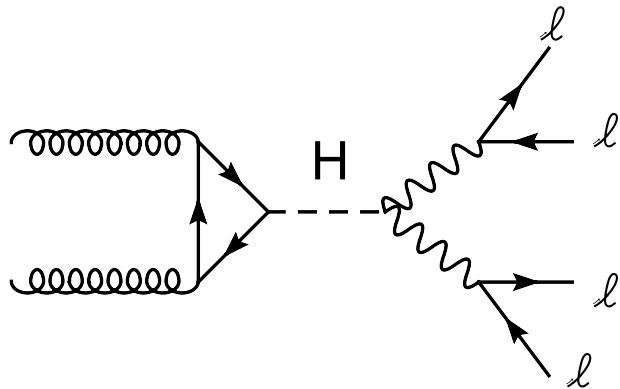

Run: 204769  
Event: 71902630  
Date: 2012-06-10  
Time: 13:24:31 CEST

# The $H \rightarrow ZZ^* \rightarrow 4l$ signal

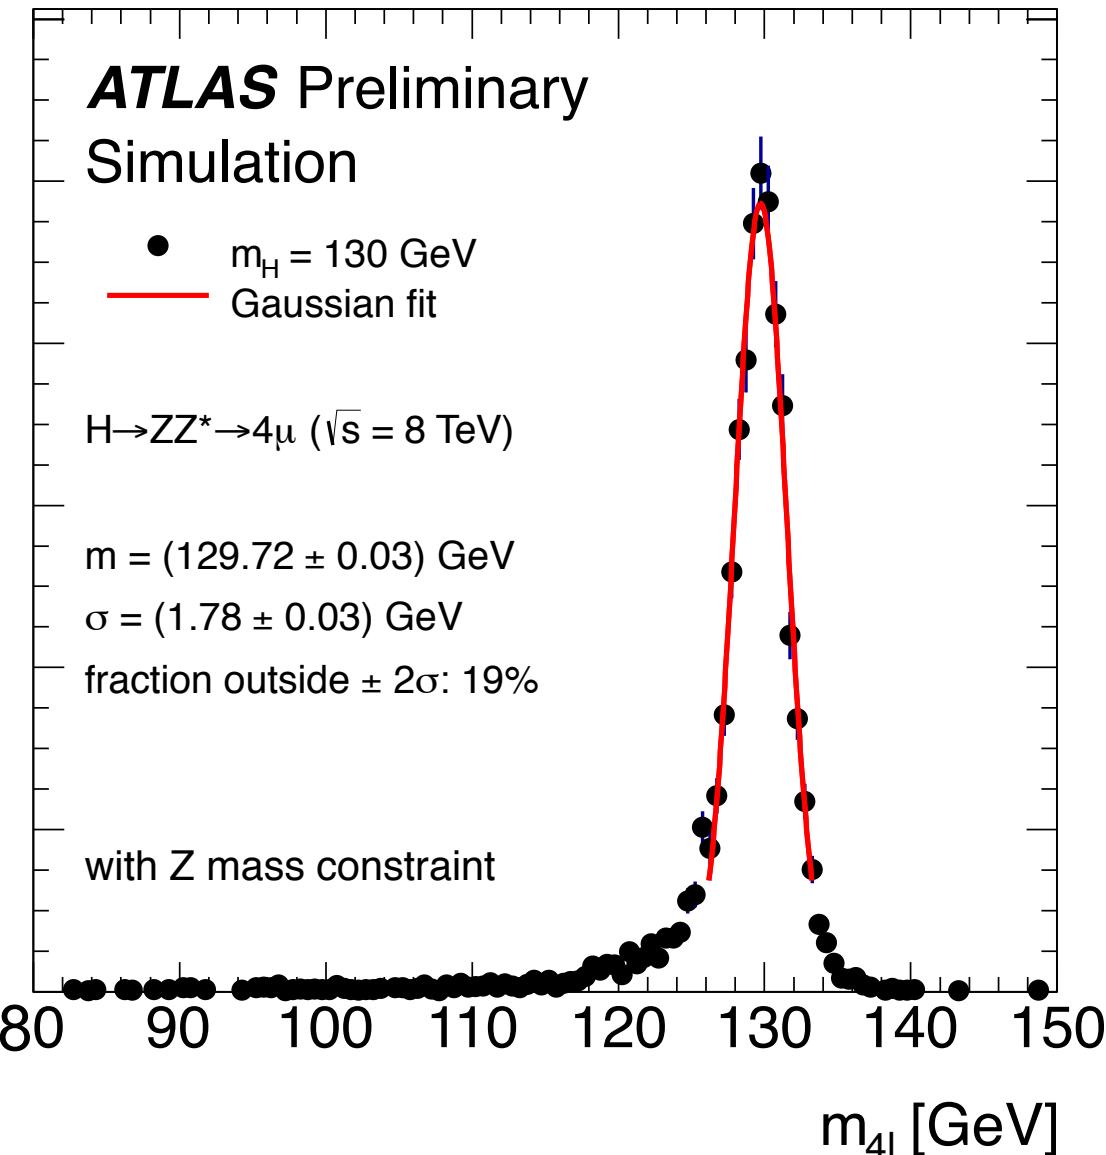

The 4-lepton channel is called the ‘golden’ channel because it has very little background and a very sharp peak

For a light Higgs boson, one of the Z-bosons must be “off shell”

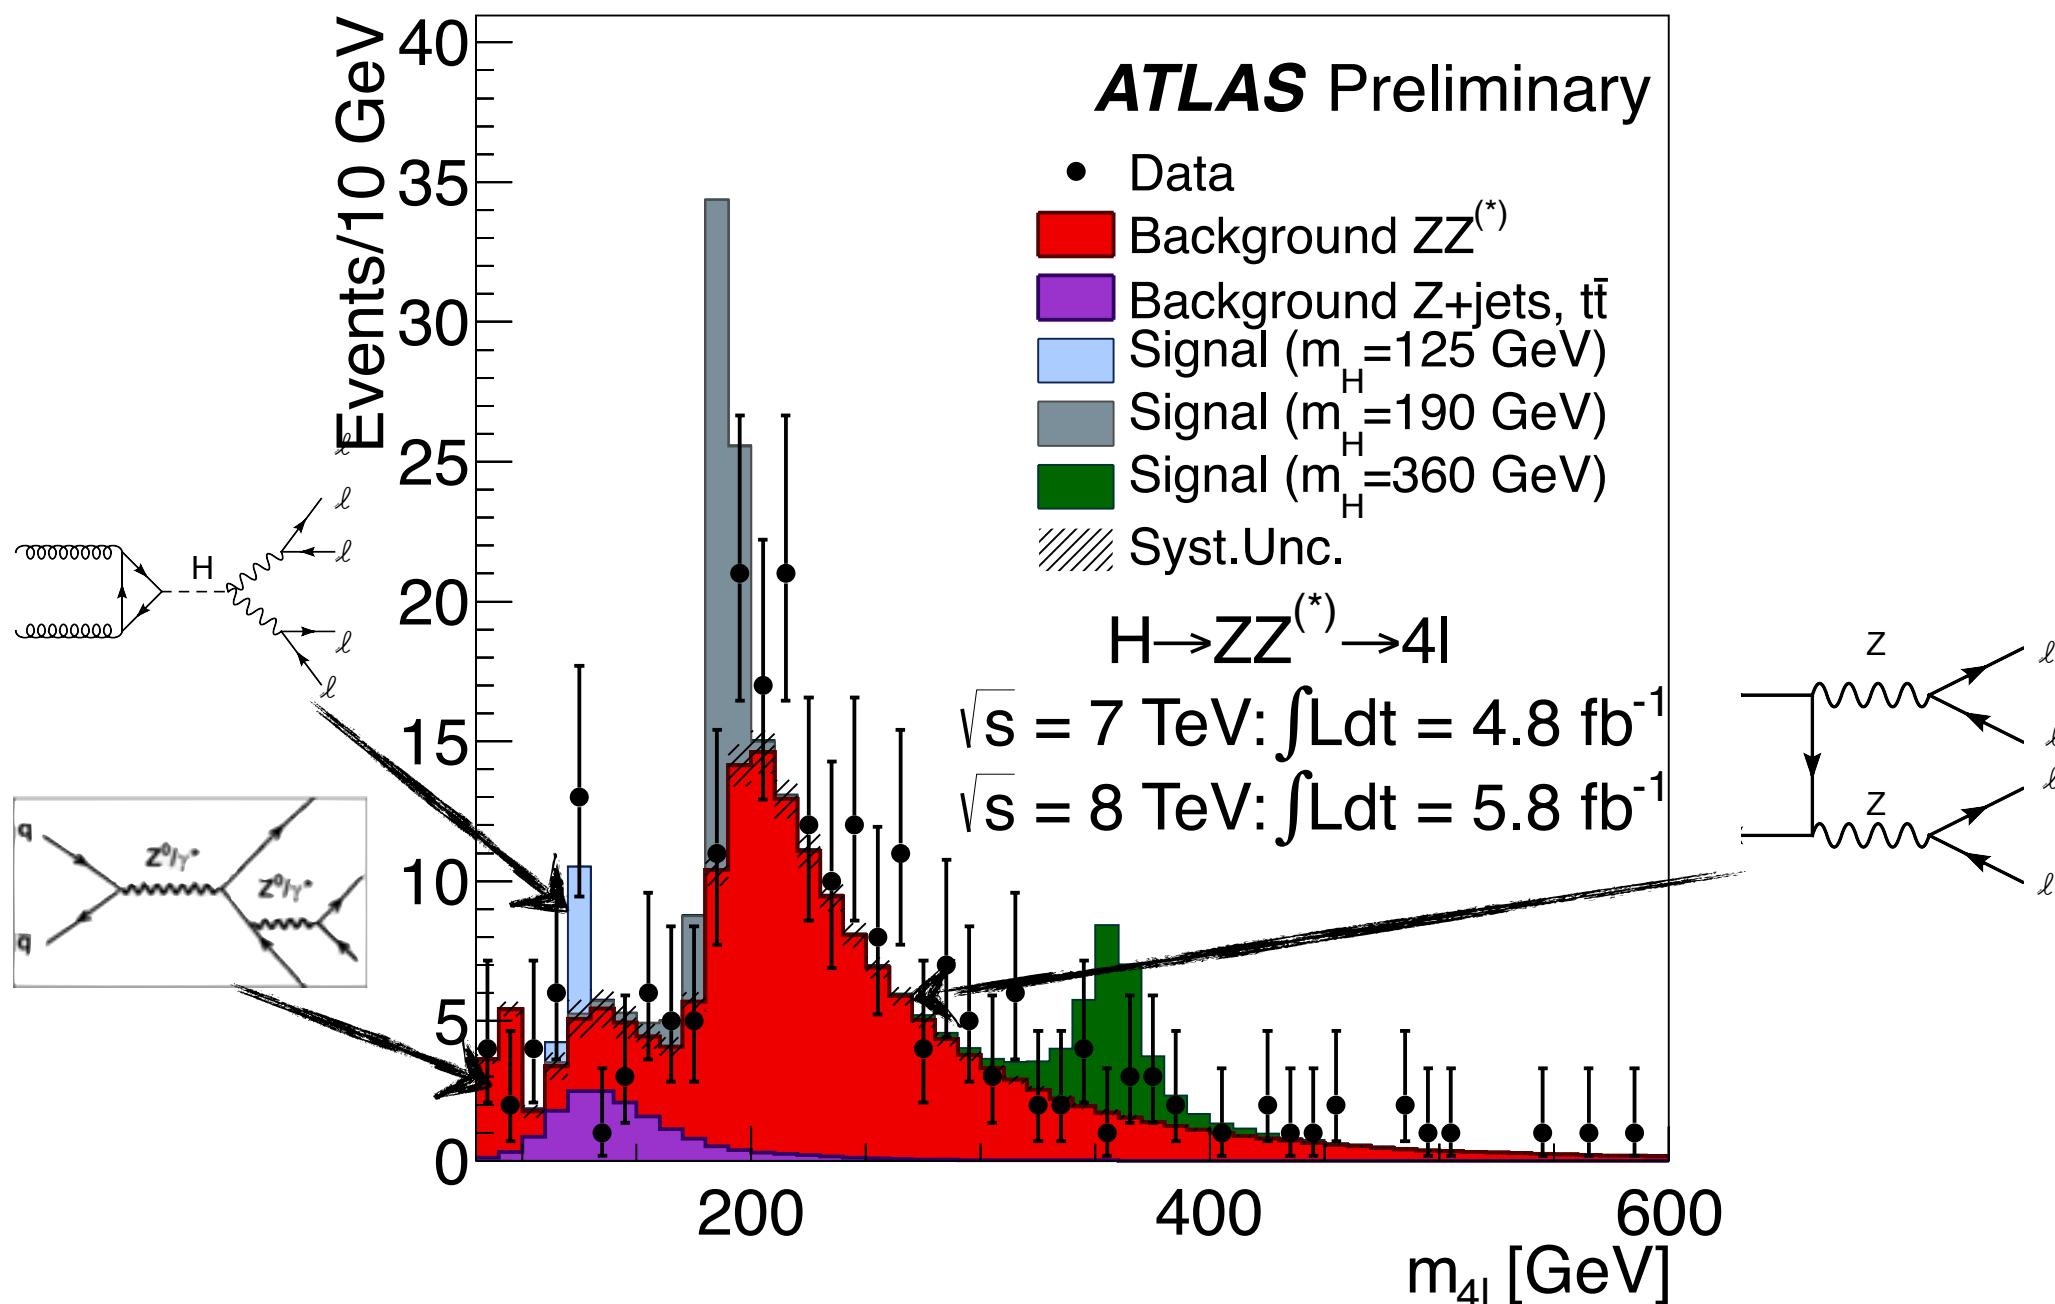

Crucial to efficiently find each lepton  
 $(90\%)^4 = 65\%$

Peak sharpest in the 4-muon channel

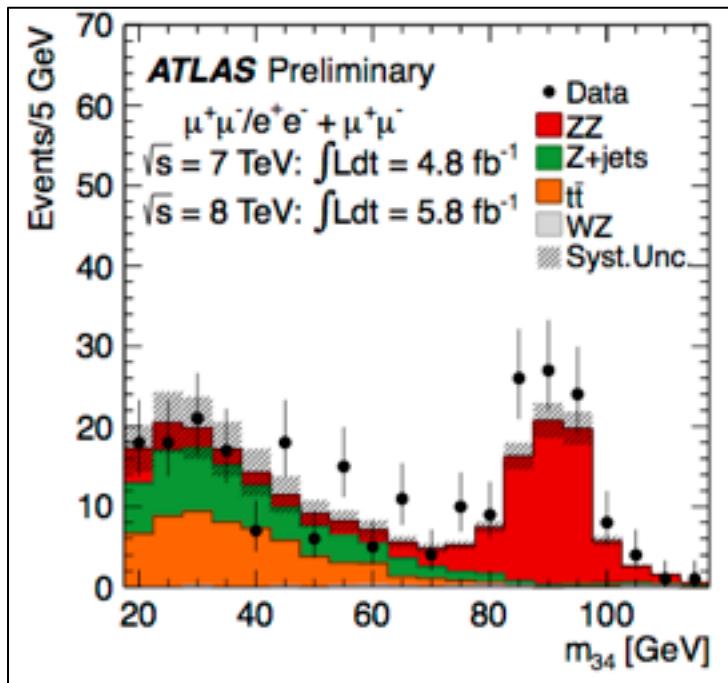

# The observation in the 4l channel

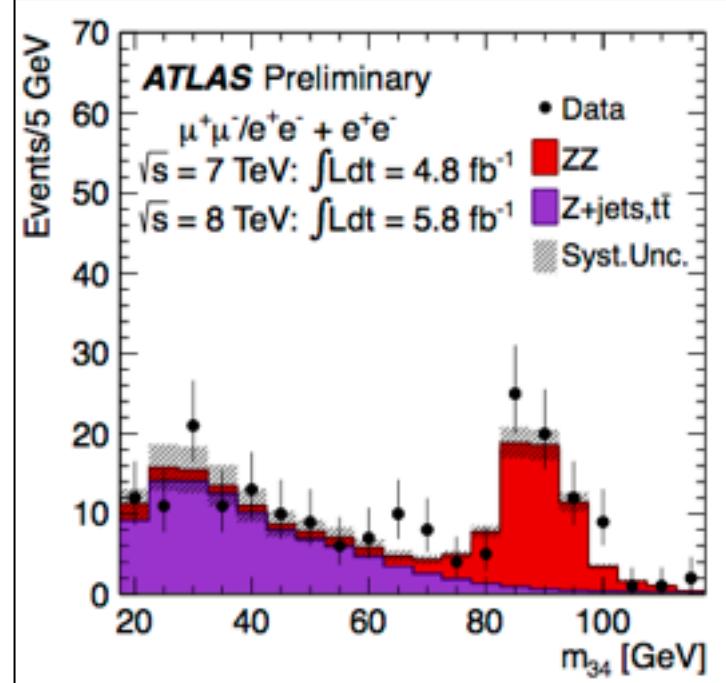

# Background composition

Details of the background are different for electrons and muons

$l_3 l_4 = \mu\mu \rightarrow$  background dominated by  $t\bar{t}$  and  $Zbb$  in low mass region

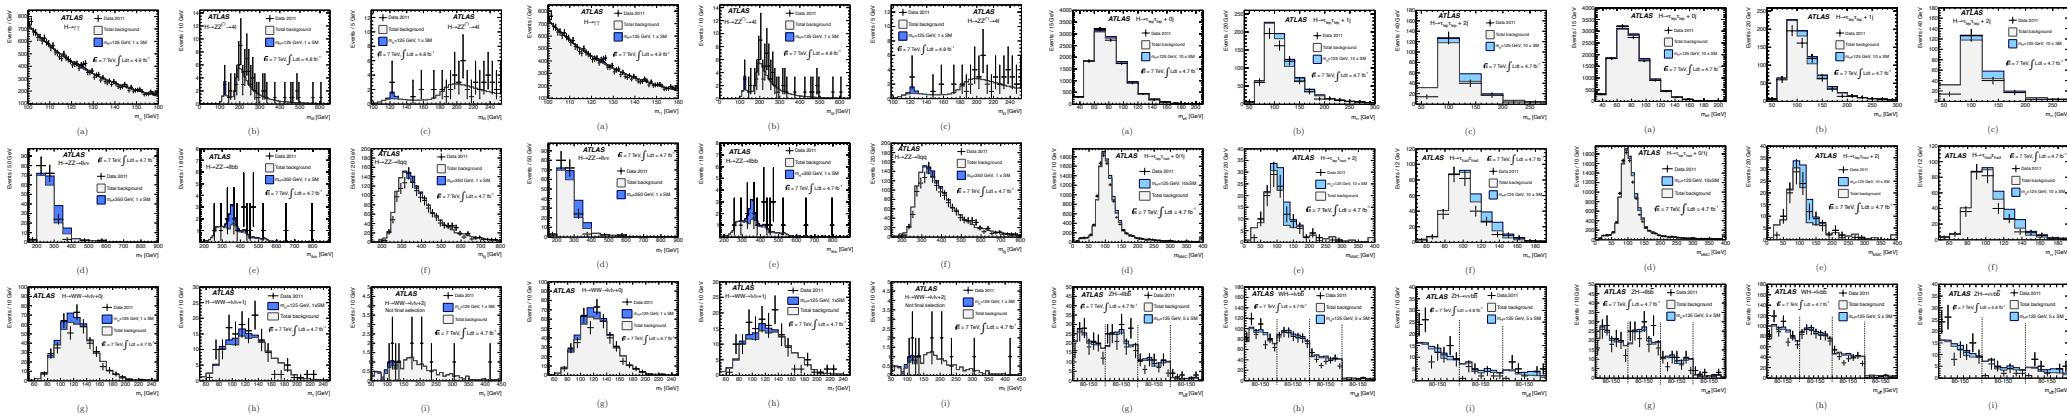

$l_3 l_4 = ee \rightarrow$  background dominated by  $Z+jets$  in low mass region

Data well described by simulation within uncertainties

Samples of  $Z+\mu$  and  $Z+e$  used to compare efficiencies of isolation and impact parameter requirements between data and simulation: good agreement

# Modeling

# Visualizing probability models

I will represent PDFs graphically as below (directed acyclic graph)

- eg. a Gaussian  $G(x|\mu, \sigma)$  is parametrized by  $(\mu, \sigma)$
- every node is a real-valued function of the nodes below

**Channel:** a subset of the data defined by some selection requirements.

- eg. all events with 4 electrons with energy  $> 10 \text{ GeV}$
- $n$ : number of events observed in the channel
- $\nu$ : number of events expected in the channel

**Discriminating variable:** a property of those events that can be measured and which helps discriminate the signal from background

- eg. the invariant mass of two particles
- $f(x)$ : the p.d.f. of the discriminating variable  $x$

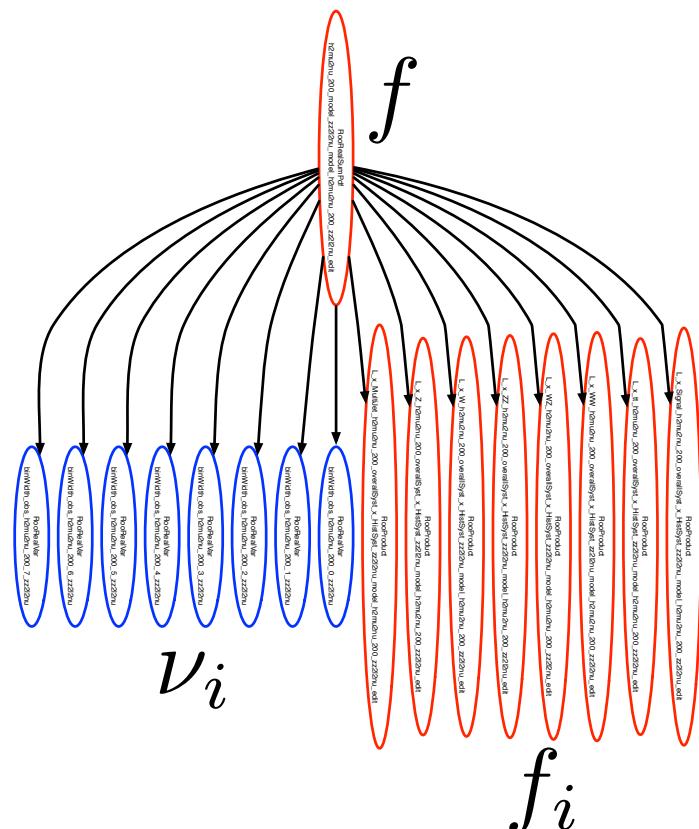

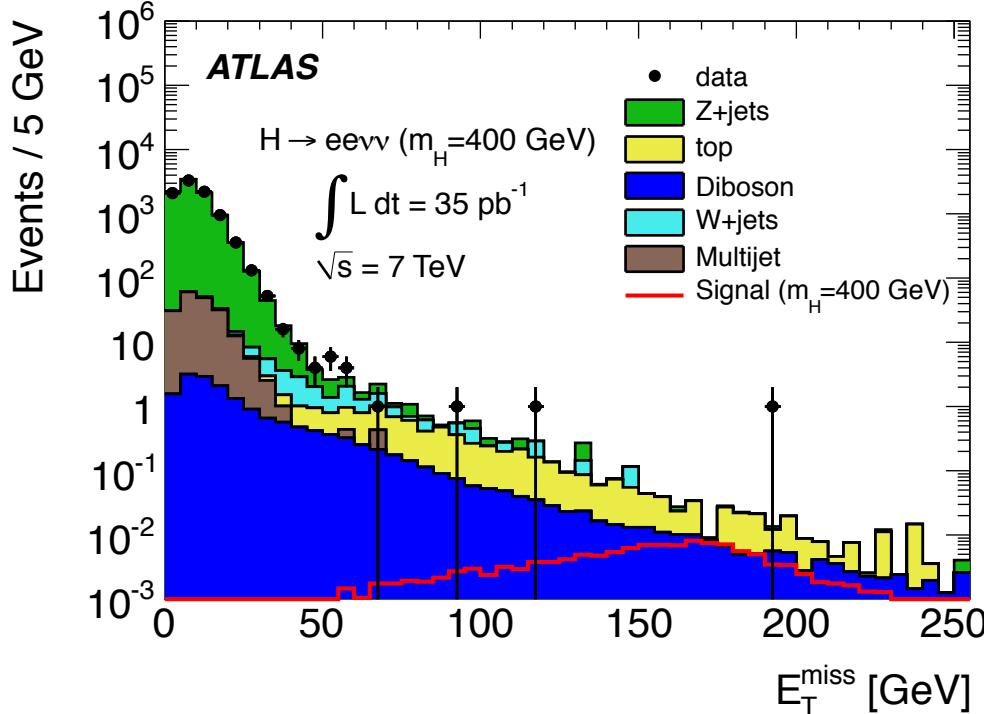

$$\mathcal{D} = \{x_1, \dots, x_n\}$$

**Marked Poisson Process:**

$$f(\mathcal{D}|\nu) = \text{Pois}(n|\nu) \prod_{e=1}^n f(x_e)$$

Total distribution is a mixture model with components corresponding to various signal and background interactions

$$f(x) = \frac{1}{\nu} \sum_{i \in \text{interactions}} \nu_i f_i(x), \quad \nu = \sum_{i \in \text{interactions}} \nu_k$$

**Parameters of interest ( $\mu$ ):** parameters of the theory that modify the rates and shapes of the distributions, eg.

- the mass of the Higgs boson  $m_H$
- the “signal strength”  $\mu=0$  no signal,  $\mu=1$  predicted signal rate

**Nuisance parameters ( $\theta$ ):** associated to uncertainty in:

- response of the detector (calibration)
- phenomenological model of interaction in non-perturbative regime

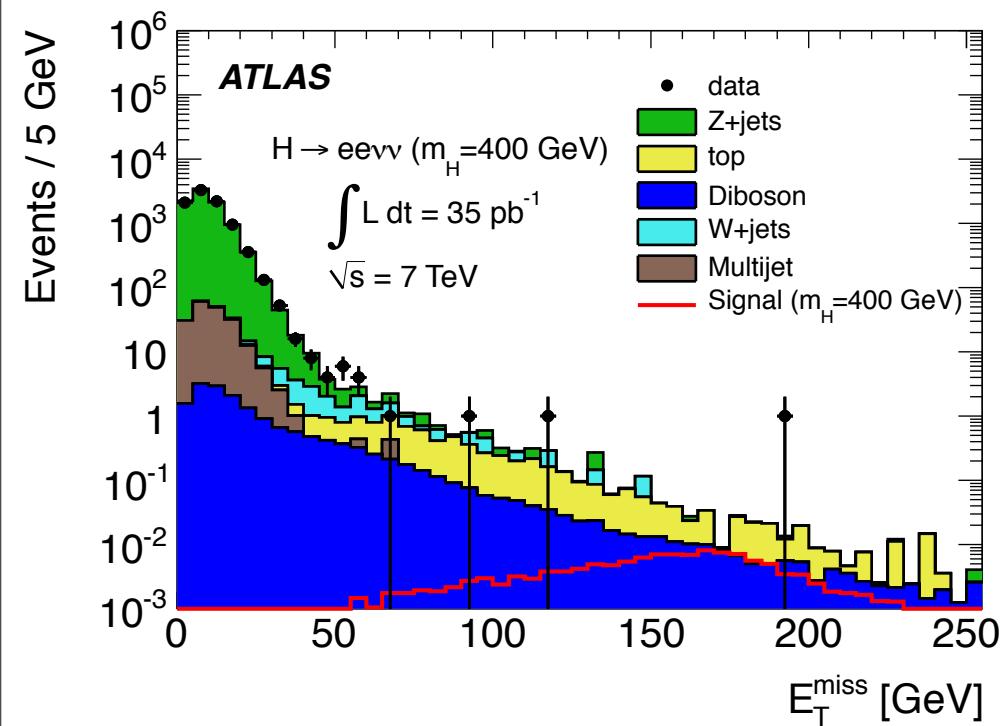

**Lead to a parametrized model:**  $\nu \rightarrow \nu(\alpha), f(x) \rightarrow f(x|\alpha)$

$$f(\mathcal{D}|\alpha) = \text{Pois}(n|\alpha) \prod_{e=1}^n f(x_e|\alpha)$$

# Incorporating Systematic Effects

Tabulate effect of individual variations of sources of systematic uncertainty

- typically one at a time evaluated at nominal and “ $\pm 1 \sigma$ ”
- use some form of interpolation to parametrize  $p^{th}$  variation in terms of **nuisance parameter**  $\alpha_p$

	Z+jets	top	Diboson	...
syst 1				
syst 2				
...				

$$f(\mathcal{D}|\boldsymbol{\alpha}) = \text{Pois}(n|\boldsymbol{\alpha}) \prod_{e=1}^n f(x_e|\boldsymbol{\alpha})$$

# Incorporating Systematic Effects

Tabulate effect of individual variations of sources of systematic uncertainty

- typically one at a time evaluated at nominal and “ $\pm 1 \sigma$ ”
- use some form of interpolation to parametrize  $p^{th}$  variation in terms of **nuisance parameter**  $\alpha_p$

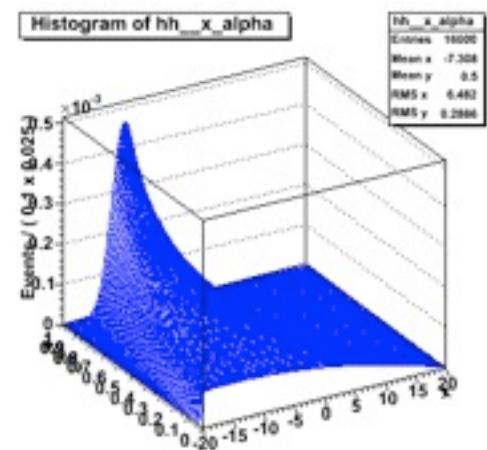

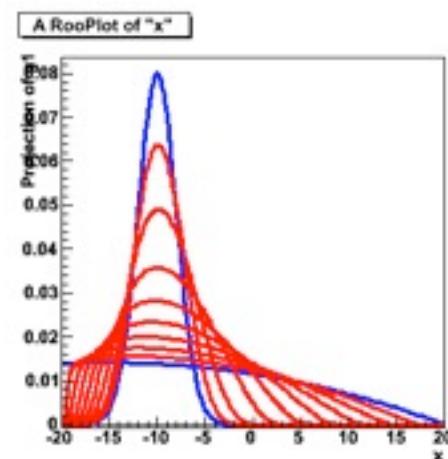

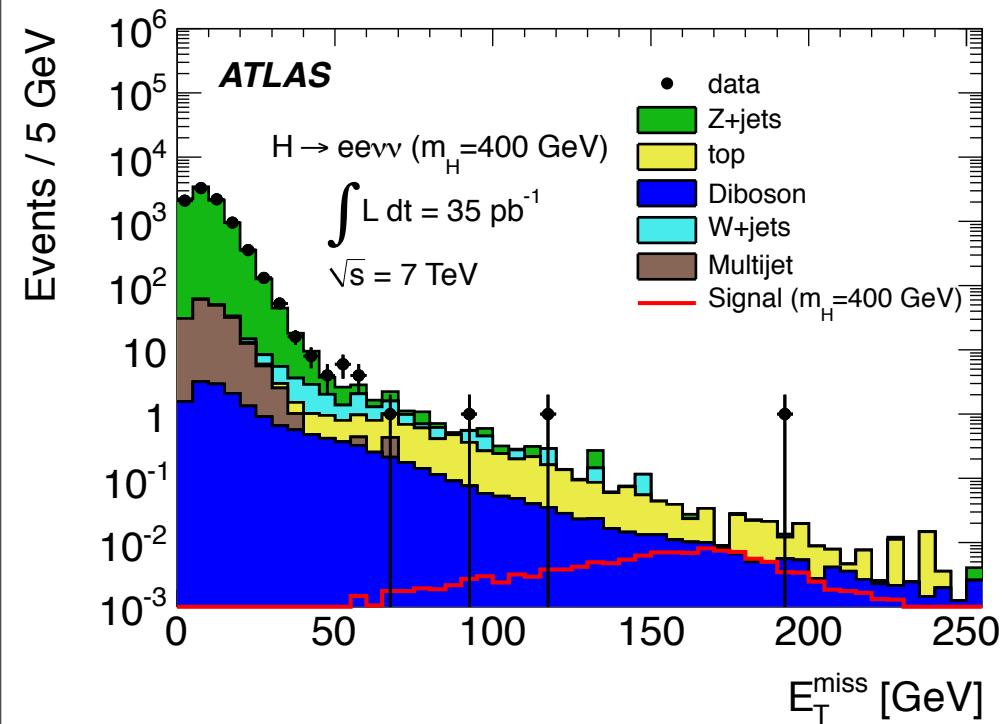

$$f(\mathcal{D}|\boldsymbol{\alpha}) = \text{Pois}(n|\boldsymbol{\alpha}) \prod_{e=1}^n f(x_e|\boldsymbol{\alpha})$$

# Incorporating Systematic Effects

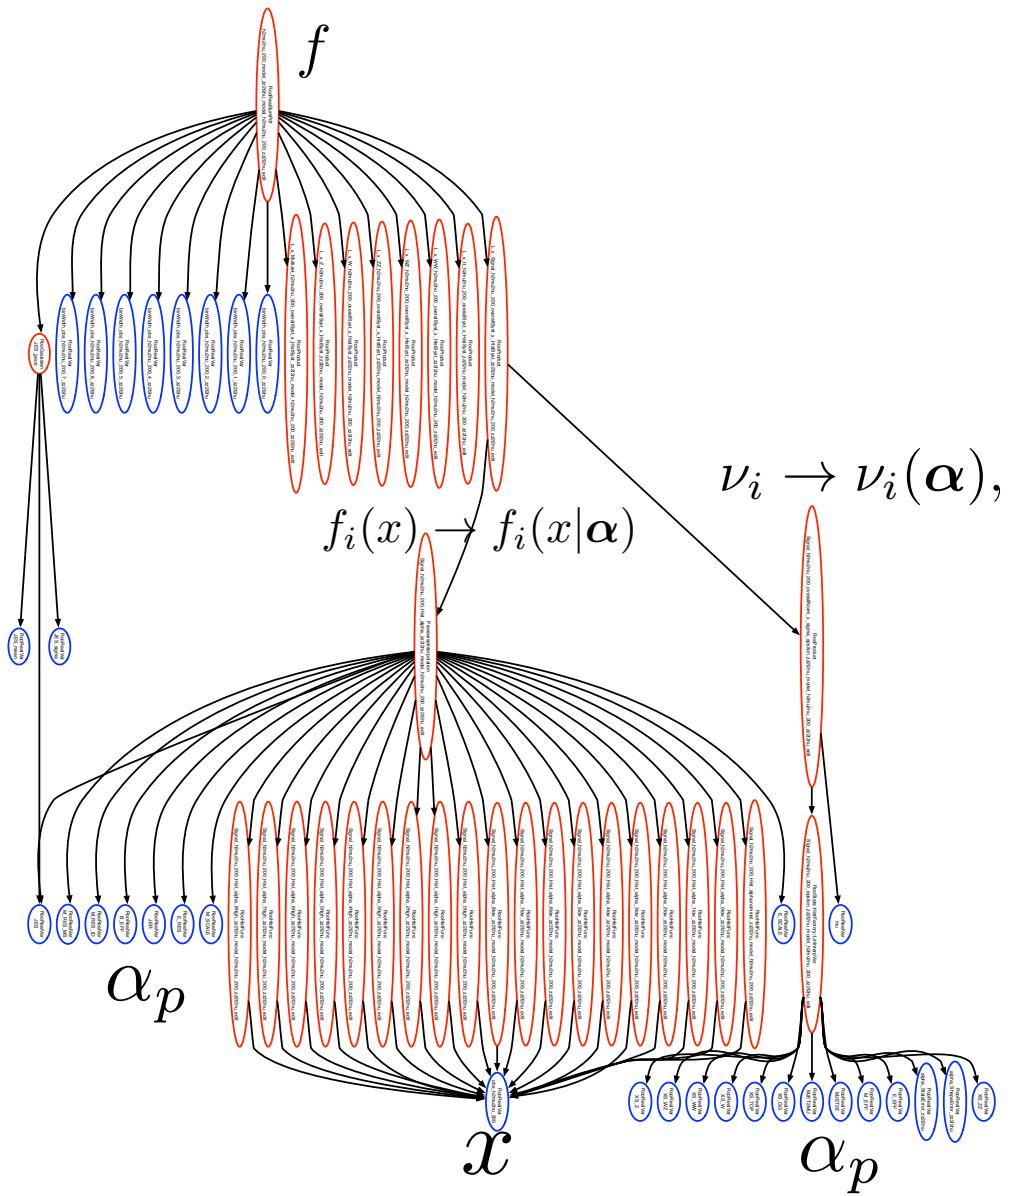

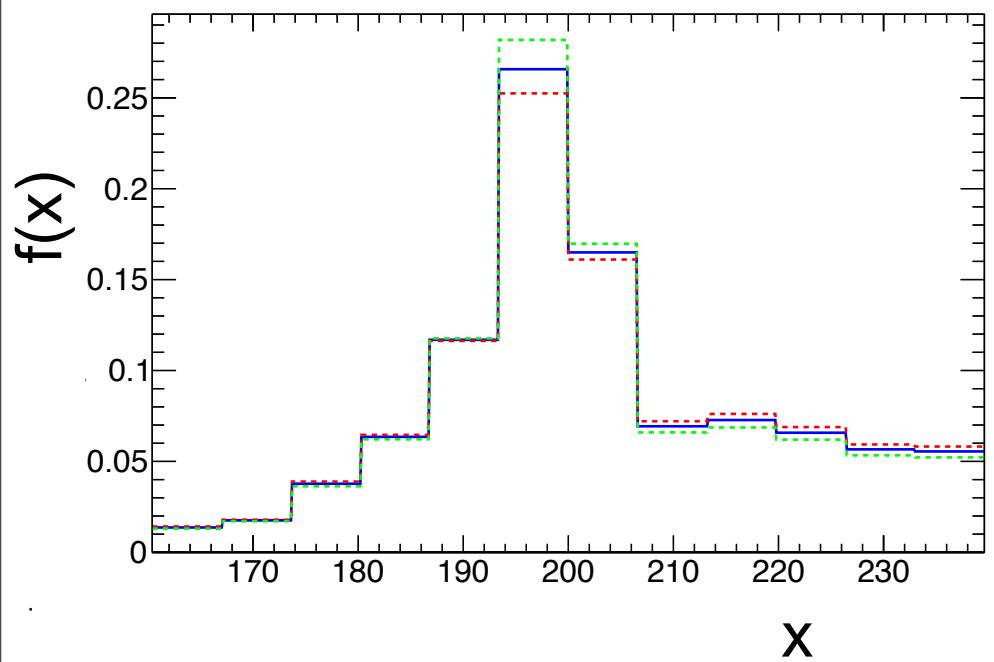

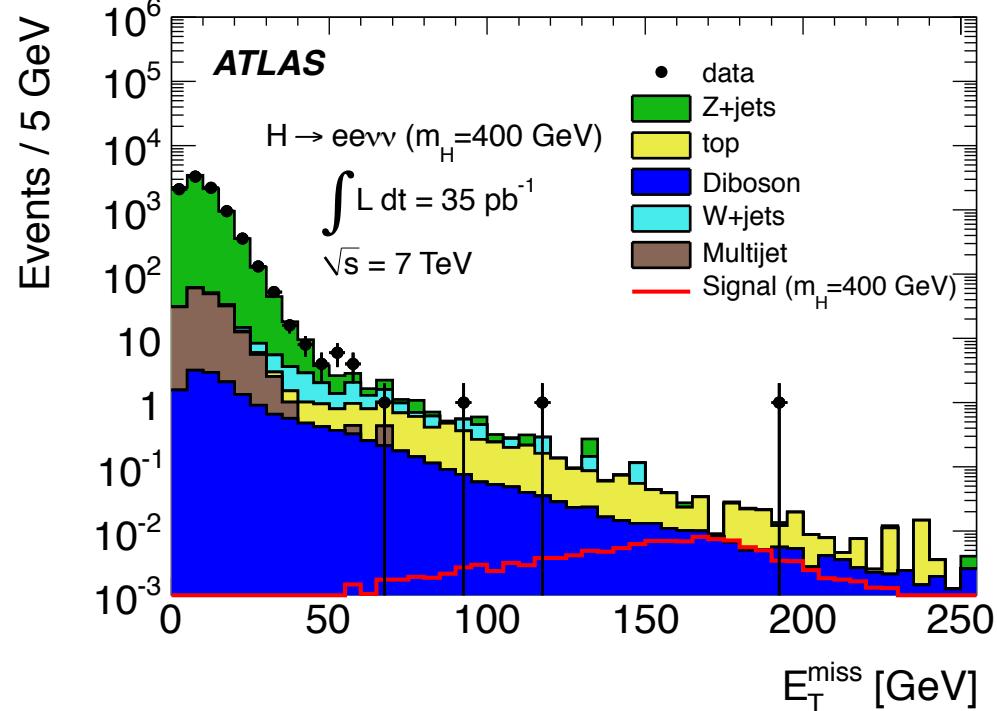

Tabulate effect of individual variations of sources of systematic uncertainty

- typically one at a time evaluated at nominal and “ $\pm 1 \sigma$ ”
- use some form of interpolation to parametrize  $p^{th}$  variation in terms of **nuisance parameter**  $\alpha_p$

$$f(\mathcal{D}|\boldsymbol{\alpha}) = \text{Pois}(n|\boldsymbol{\alpha}) \prod_{e=1}^n f(x_e|\boldsymbol{\alpha})$$

# Visualizing the model for one channel

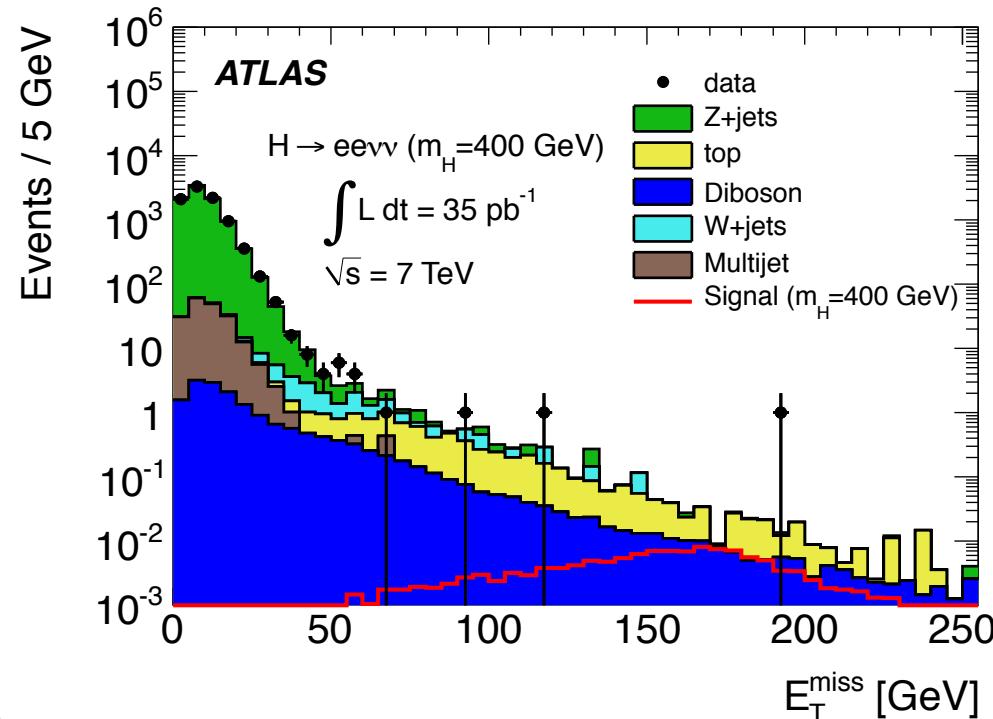

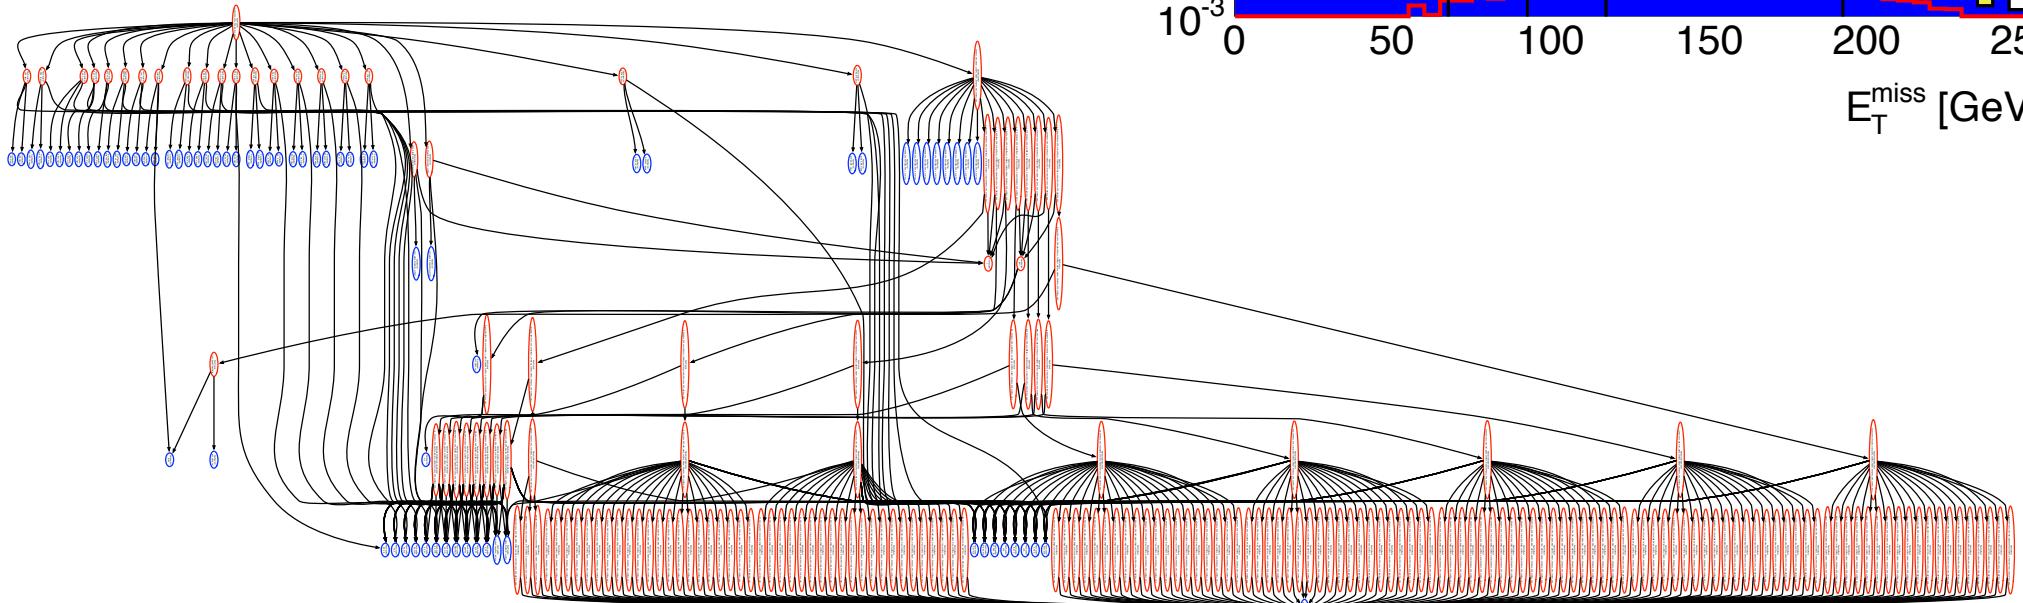

ium, July 10, 2012

51

# Visualizing the model for one channel

After parametrizing each component of the mixture model, the pdf for a single channel might look like this

**Simultaneous Multi-Channel Model:** Several disjoint regions of the data are modeled simultaneously. Identification of common parameters across many channels requires coordination between groups such that meaning of the parameters are really the same.

$$f_{\text{sim}}(\mathcal{D}_{\text{sim}} | \boldsymbol{\alpha}) = \prod_{c \in \text{channels}} \left[ \text{Pois}(n_c | \nu_c(\boldsymbol{\alpha})) \prod_{e=1}^{n_c} f_c(x_{ce} | \boldsymbol{\alpha}) \right]$$

where  $\mathcal{D}_{\text{sim}} = \{\mathcal{D}_1, \dots, \mathcal{D}_{c_{\max}}\}$

**Control Regions:** Some channels are not populated by signal processes, but are used to constrain the nuisance parameters

# Combined ATLAS Higgs Search for 2011

**State of the art:** Our most recent combined Higgs search includes 100 disjoint channels and >100 nuisance parameters

- Models for individual channels come from about 11 sub-groups performing dedicated searches for specific Higgs decay modes
- In addition low-level performance groups provide tools for evaluating systematic effects and corresponding constraint terms

Higgs Decay	Subsequent Decay	Sub-Channels	$m_H$ Range [GeV]	$\int L dt$ [fb $^{-1}$ ]

# Evolution of the excess

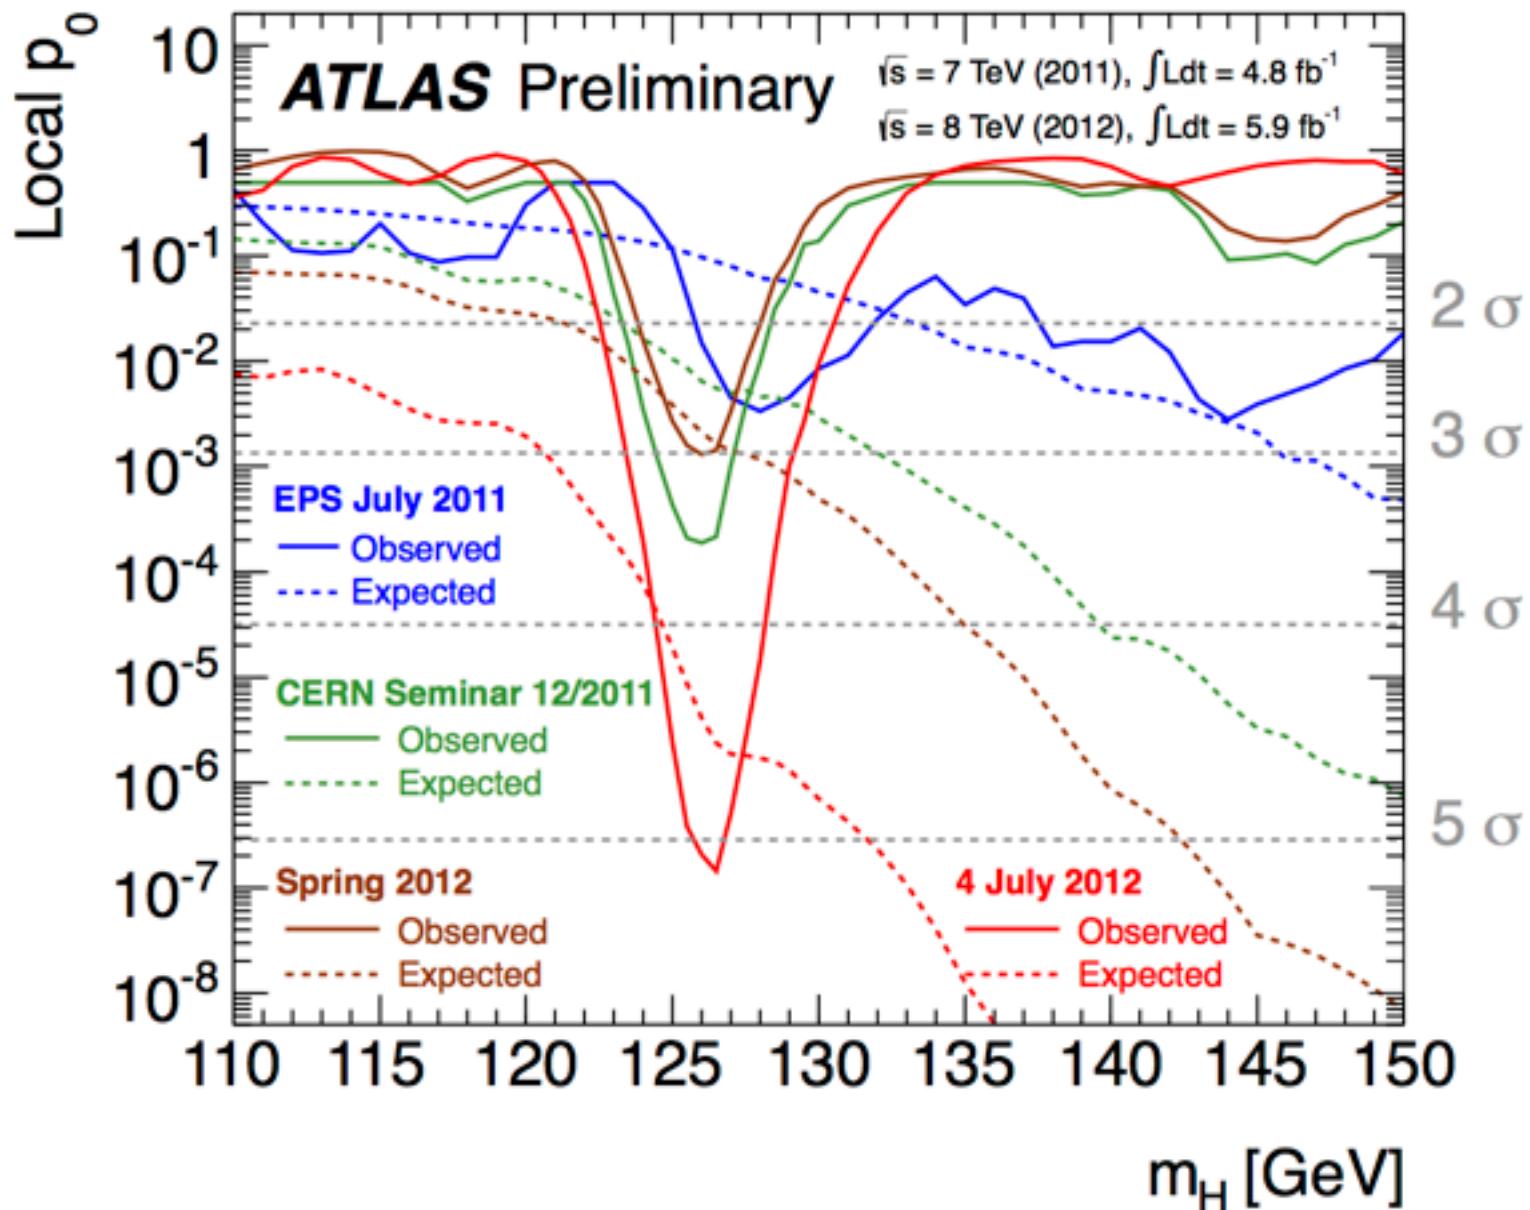

# Evolution of the excess

# What's next for this “Higgs-like” particle

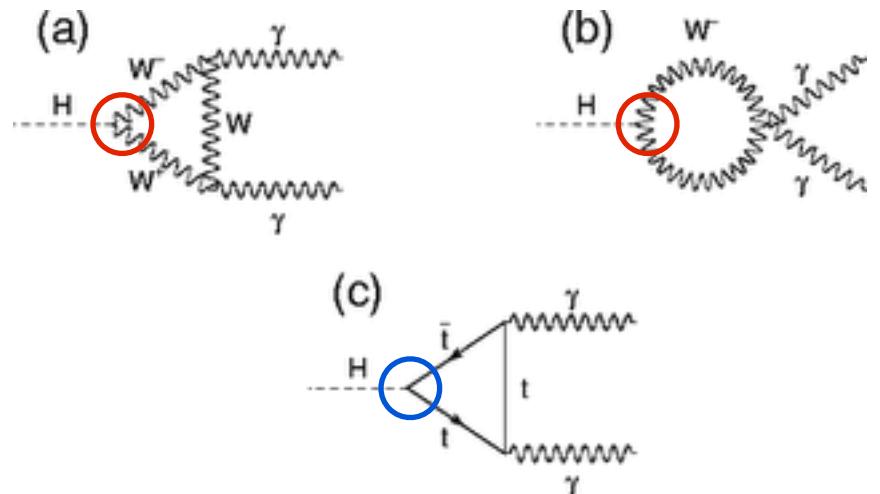

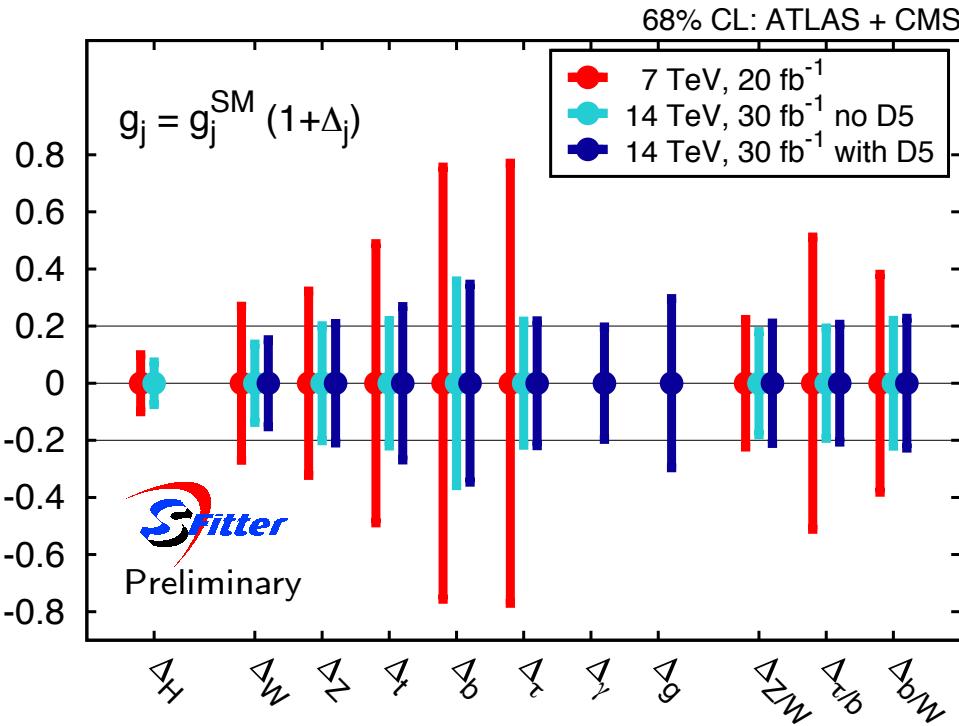

We need to study the different production modes

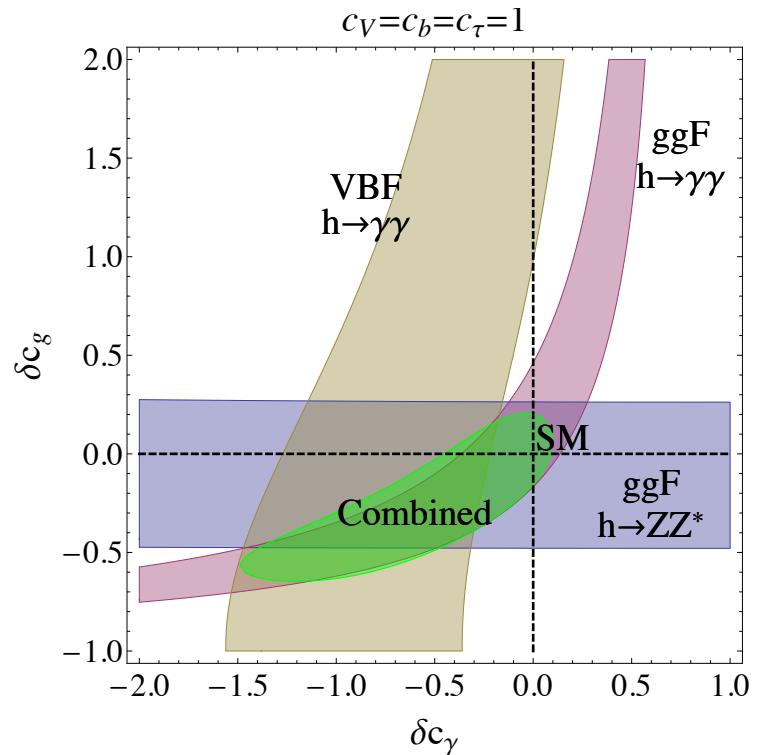

# What's next for this “Higgs-like” particle

[Dührssen, Klute, Lafaye, Plehn, Rauch, Zerwas]

Carmi, et al. [arXiv:1202.3144]

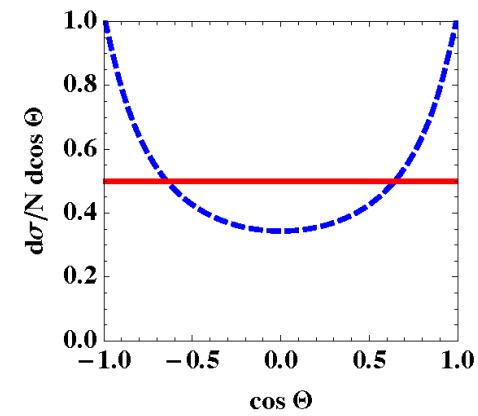

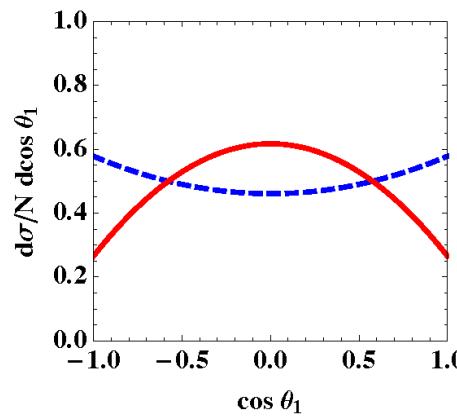

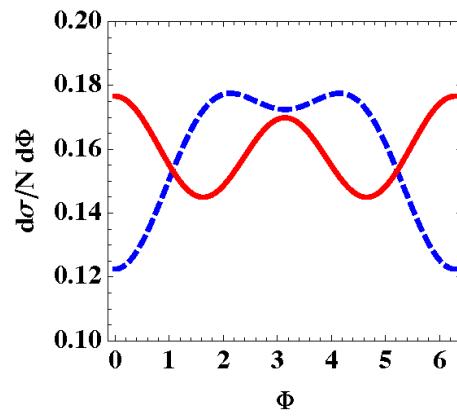

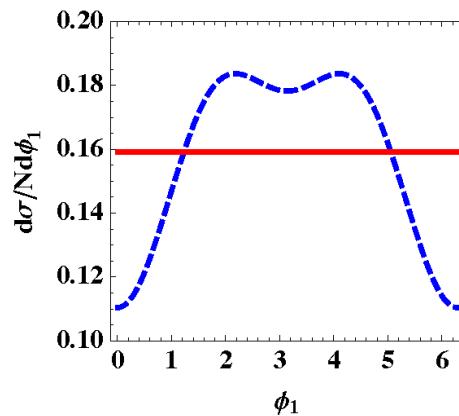

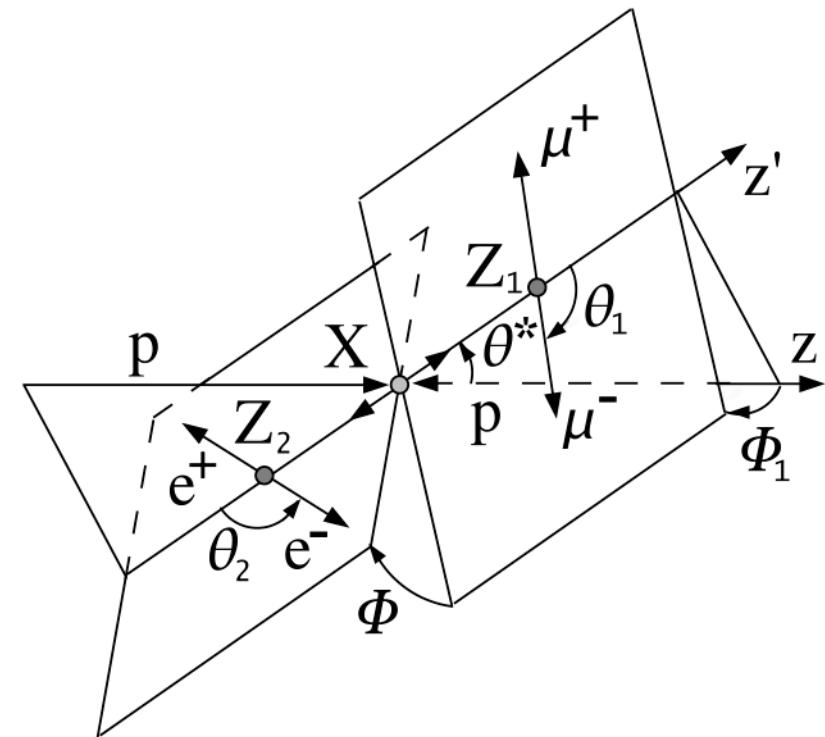

# What's next for this “Higgs-like” particle

We need to measure discrete quantum numbers

The observation of  $H \rightarrow \gamma\gamma$  excludes the possibility that the particle is Spin-1 via the Landau–Yang theorem

Spin and CP properties to be measured in various channels

Gainer, et al. [arXiv:1108.2274]

We have observed a new particle with a mass near 126 GeV at the  $5\sigma$  level!

...and this is just the beginning.
